1000 - CLEARING AND GRUBBING

1. DESCRIPTION

This work consists of clearing, grubbing, removing and disposing of vegetation and debris within the limits of the right-of-way, borrow, and easement areas except objects designated to be removed in accordance with other sections of these specifications.

2. MATERIALS

Not specified.

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 100.

4. METHOD OF MEASUREMENT

A. Remove Trees shall be measured on a per each basis for any trees over 6-inches in diameter. The diameter will be measured 2-feet above the ground.

B. Remove Stumps shall be measured on a per each basis for any stump over 6-inches in diameter. The diameter will be measured 2-feet above the ground.

C. Clearing will be measured on a lump sum basis. No separate measurement for trees and stumps is required.

5. BASIS OF PAYMENT

A. Remove Trees will be paid for at the contract unit price per each for removal and disposal of vegetation and debris. This includes removal of tree and stump. When these items are not included in the contract, the removal of trees and stumps will be incidental to the lump sum price of Clearing.

B. Remove Stumps will be paid for at the contract unit price per each for removal and disposal of vegetation and debris. This only includes removal of stump. When these items are not included in the contract, the removal of trees and stumps will be incidental to the lump sum price of Clearing.

C. Clearing will be paid as a lump sum for removal and disposal of vegetation and debris.

END OF CLEARING AND GRUBBING
1100 - REMOVAL OF STRUCTURES AND OBSTRUCTIONS

1. DESCRIPTION

This work consists of removal and disposal of buildings, fences, structures, pavements, abandoned pipe lines, pipe culverts, other obstructions which are not designated or permitted to remain, and other obstructions which are not removed and disposed of under other items in the contract. This work shall also include the salvaging of designated materials and backfilling the resulting trenches, holes and pits.

2. MATERIALS

Not specified.

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 110.

4. METHOD OF MEASUREMENT

A. **Removal of Structure and Obstruction** measurement shall be on a lump sum basis for the removal of all structures and obstructions, no separate measurements shall be made.

B. **Remove PCC Pavement** measurement shall be on a square yard basis. Removal of curb and gutter is considered incidental and will be considered part of the PCC pavement.

C. **Remove Asphalt Pavement** measurement shall be on a square yard basis.

D. **Remove Sidewalk** measurement shall be on a square yard basis.

E. **Remove Curb and Gutter** measurement shall be on linear basis.

F. **Remove Storm Sewer Manhole, ≤ 8-feet** measurement shall be on a unit basis for any storm sewer manhole 8-feet or less in depth being removed.

G. **Remove Storm Sewer Manhole, > 8-feet** measurement shall be on a unit basis for any storm sewer manhole more than 8-feet in depth being removed.

H. **Remove San Sewer Manhole, ≤ 8-feet** measurement shall be on a unit basis for any sanitary sewer manhole 8-feet or less in depth being removed.

I. **Remove San Sewer Manhole, > 8-feet** measurement shall be on a unit basis for any sanitary sewer manhole more than 8-feet in depth being removed.

J. **Remove Inlet, ≤ 8-feet** measurement shall be on a unit basis for any inlets 8-feet or less in depth being removed.

K. **Remove Inlet, > 8-feet** measurement shall be on a unit basis for any inlets more than 8-feet in depth being removed.

L. **Remove Storm Sewer Pipe** measurement shall be on a linear basis. Measurement shall include the end sections.

M. **Remove San Sewer Pipe** measurement shall be on a linear basis.
N. **Remove Water Main** measurement shall be on a linear basis.
O. **Remove Water Fittings** measurement shall be on a unit basis.

P. **Remove Water Box** measurement shall be on a unit basis.
Q. **Remove Fire Hydrant** measurement shall be on a unit basis.

5. **BASIS OF PAYMENT**

A. **Removal of Structure and Obstruction** payment will be a lump sum payment for removal and disposal of such items, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

B. **Remove PCC Pavement** will be paid for at the contract unit price per square yard for removal and disposal of PCC pavement and curb and gutter, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

C. **Remove Asphalt Pavement** will be paid for at the contract unit price per square yard for removal and disposal of asphalt pavement, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

D. **Remove Sidewalk** will be paid for at the contract unit price per square yard for removal and disposal of sidewalks, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

E. **Remove Curb and Gutter** will be paid for at the contract unit price per linear feet for removal and disposal of curb and gutter, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

F. **Remove Storm Sewer Manhole, ≤ 8-feet** will be paid for at the contract unit price per each for removal and disposal of storm sewer manholes 8-feet or less in depth, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

G. **Remove Storm Sewer Manhole, > 8-feet** will be paid for at the contract unit price per each for removal and disposal of storm sewer manholes more than 8-feet in depth, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

H. **Remove San Sewer Manhole, ≤ 8-feet** will be paid for at the contract unit price per each for removal and disposal of sanitary sewer manholes 8-feet or less in depth, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

I. **Remove San Sewer Manhole, > 8-feet** will be paid for at the contract unit price per each for removal and disposal of sanitary sewer manholes more than 8-feet in depth, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.
J. **Remove Inlet, ≤ 8-feet** will be paid for at the contract unit price per each for removal and disposal of inlets 8-feet or less in depth, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

K. **Remove Inlet, > 8-feet** will be paid for at the contract unit price per each for removal and disposal of inlets more than 8-feet in depth, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

L. **Remove Storm Sewer Pipe** will be paid for at the contract unit price per each for removal and disposal of storm sewer pipe, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

M. **Remove San Sewer Pipe** will be paid for at the contract unit price per each for removal and disposal of sanitary sewer pipe, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

N. **Remove Water Main** will be paid for at the contract unit price per each for removal and disposal of water pipe, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

O. **Remove Water Fittings** will be paid for at the contract unit price per each for removal and disposal of water fittings, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

P. **Remove Water Box** will be paid for at the contract unit price per each for removal and disposal of water box, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

Q. **Remove Fire Hydrant** will be paid for at the contract unit price per each for removal and disposal of fire hydrant, excavation and subsequent backfill incidental to their removal. Payment will also include salvage of materials removed, their custody, preservation, storage on the right-of-way, and disposal as specified.

**END OF REMOVAL OF STRUCTURES AND OBSTRUCTIONS**
1200 - ROADWAY AND DRAINAGE EXCAVATION AND EMBANKMENT CONSTRUCTION

1. DESCRIPTION

This work consists of excavation, placement and disposal of material necessary for the construction of the roadway including hauling, watering, and when required, the placement of select subgrade topping.

2. MATERIALS

A. Unclassified Excavation: All materials except those classified as rock excavation, unclassified/rock excavation, or muck excavation, encountered during the construction of the work, regardless of their nature or manner, in which they are removed, will be considered unclassified excavation.

B. Unclassified/Rock Excavation: Unclassified/Rock excavation consists of the excavation and placement of both soil and rock when both are anticipated throughout the project area. This item differs from unclassified excavation in that an undetermined quantity of rock shall be excavated in addition to the materials included in unclassified excavation.

C. Rock Excavation: Rock excavation shall consist of a sound, solid mass of mineral matter in place and of such hardness and texture that it cannot be loosened or broken down by ripping in a single pass with a tractor mounted hydraulic ripper equipped with one digging point. The ripper and tooth shall be of a standard design, adequately sized and used with a large crawler type tractor rated between 370 and 460 net fly wheel horsepower, operating in low gear, with sufficient downward force on the ripper.

D. Muck Excavation: Muck excavation consists of the removal and disposal of saturated organic mixtures of soils and organic matter which requires additional work or equipment not normally required for unclassified excavation.

E. Unclassified Excavation, Digouts: Unclassified excavation, digouts consists of the removal and disposal of unstable material below an existing surface on which surfacing material is to be placed. The exposed undercut surface shall be compacted prior to backfilling.

F. Option Borrow Excavation: Material, furnished by the City, from a pit or other source. The Contractor may use this material at the Contractor’s option.

G. Contractor Furnished Borrow Excavation: Material, furnished by the Contractor, from a pit or other source.

H. Borrow Unclassified Excavation: Material, furnished by the City, from a pit or other source. The Contractor must use this material.

I. Select Subgrade Topping: Sources of selected subgrade topping material will be confined to the areas specified. The upper 6 inches of sodded areas, materials with high humus or silt content and outwashed material in poorly drained areas will not be acceptable. Unsatisfactory material found within the specified sources shall not be used as select subgrade topping.

J. Undercutting: Undercutting shall consist of excavating, replacing, and compacting the material immediately below the finished subgrade surface, at locations specified and to the depth specified.

K. Water: Water shall be furnished by the Contractor and shall be free from injurious matter.
3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 120.

4. METHOD OF MEASUREMENT

A. **Unclassified Excavation, Unclassified/Rock Excavation, Rock Excavation, Muck Excavation, and Undercutting** will be measured in cubic yards. Measurement will include unsuitable material excavated and removed to obtain proper compaction in cut sections and in foundations for fill sections.

   Accepted quantities of excavation will be measured in its original position by cross sectioning. The area excavated will include overbreakage or slides not due to carelessness of the Contractor.

B. **Select Subgrade Topping** will be measured in cubic yards. Measurement will include the volume measured from its original position by cross sectioning plus shrinkage. The shrinkage factor shall be 1.3.

C. **Option Borrow Excavation** will be measured in cubic yards from its original position by cross sectioning.

   Original cross sections will be taken prior to removal of any material and final sections will be taken following placement of topsoil. Salvaged topsoil which is stockpiled from the optioned borrow sources will be included as option borrow excavation.

   The quantity of topsoil stockpiled and respread on optioned borrow sources will be determined by measuring the stockpiles prior to removal of the material from the stockpiles.

D. **Contractor Furnished Borrow** will be measured in cubic yards from its original position by cross sectioning.

   Original cross sections will be taken prior to removal of any material and final sections will be taken following placement of topsoil. Salvaged topsoil will not be measured.

E. **Borrow Unclassified Excavation** will be measured in cubic yards from its original position by cross sectioning.

   Original cross section will be taken prior to removal or any material and final cross sections will be taken following replacement of topsoil. Salvaged topsoil stockpiled from the borrow sources will be included as borrow unclassified excavation.

   The quantity of topsoil stockpiled and respread on borrow sources will be determined by measuring the stockpiles prior to removal of the material from the stockpiles.

F. **Water** will be measured by the thousand gallons to the nearest 0.1-MGal.

5. BASIS OF PAYMENT

A. **Unclassified Excavation, Unclassified/Rock Excavation, Rock Excavation, Muck Excavation**, completed and accepted work will be paid for at the contract unit price per cubic yard. Payment will be full compensation for excavation, construction and compaction of cuts and embankments, shaping of
slopes, finishing of surface, disposal of surplus materials, completion of subgrade, shoulders, and roadway, and maintenance.

Scarifying, shaping and recompacting shall be incidental. Separate payment will not be made.

B. **Undercutting** completed and accepted work will be paid for at the contract unit price per cubic yard. Payment will be full compensation for excavation, construction and compaction of cuts and embankments, shaping of slopes, finishing of surface, disposal of surplus materials, completion of subgrade, shoulders, and roadway, and maintenance.

Scarifying, shaping and recompacting shall be incidental. Separate payment will not be made.

Payment will be full compensation for work over and above that normally required for unclassified excavation.

C. **Select Subgrade Topping** will be paid for at the contract unit price per cubic yard. Payment will be full compensation for work over and above that normally required for embankment construction.

D. **Option Borrow Excavation** will be paid for at the contract unit price per cubic yard. Payment will be full compensation for excavation and furnishing the material on the project, construction and compaction of embankments, shaping of slopes, finishing of surface, completion of subgrade, shoulders, and roadway, and maintenance, and for furnishing materials (except topsoil), labor, and incidentals required for restoration of the pit.

E. **Contractor Furnished Borrow** will be paid for at the contract unit price per cubic yard. Payment will be full compensation for excavation and furnishing the material on the project, construction and compaction of embankments, shaping of slopes, finishing of surface, completion of subgrade, shoulders, and roadway, and maintenance, and for furnishing materials (except topsoil), labor, and incidentals required for restoration of the pit.

F. **Borrow Unclassified Excavation** will be paid for at the contract unit price per cubic yard. Payment will be full compensation for excavation and furnishing the material on the project, construction and compaction of embankments, shaping of slopes, finishing of surface, completion of subgrade, shoulders, and roadway, and maintenance, and for furnishing materials (except topsoil), labor, and incidentals required for restoration of the pit.

Topsoil stockpiled from the borrow source will be respread and paid for at the contract unit price per cubic yard of borrow unclassified excavation and placing topsoil.

G. **Water** will be paid for at the contract unit price per thousand gallons (MGal).

**END OF ROADWAY AND DRAINAGE EXCAVATION AND EMBANKMENT CONSTRUCTION**
1300 - ROADWAY SHAPING

1. DESCRIPTION

This work consists of reshaping an existing surface prior to placement of surfacing material.

2. MATERIALS

Not specified.

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 210.

4. METHOD OF MEASUREMENT

A. Surface Preparation will be measured to the nearest 0.001-mile, horizontally along the centerline.

B. Ordinary Roadway Shaping will be measured to the nearest 0.001-mile, horizontally along the centerline.

C. Heavy Roadway Shaping will be measured to the nearest 0.001-mile, horizontally along the centerline.

5. BASIS OF PAYMENT

A. Surface Preparation will be paid for at the contract unit price per mile. Payment will be full compensation for scarifying, reworking, shaping, compacting, reprocessing blotters if required, equipment, labor and incidentals necessary to satisfactorily complete the work.

B. Ordinary Roadway Shaping will be paid for at the contract unit price per mile. Payment will be full compensation for equipment, labor and incidentals necessary to satisfactorily remove the existing surfacing, shape, replace and compact the materials specified.

C. Heavy Roadway Shaping will be paid for at the contract unit price per mile. Payment will be full compensation for equipment, labor and incidentals necessary to satisfactorily remove the existing surfacing, shape, replace and compact the materials specified.

END OF ROADWAY SHAPING
1. DESCRIPTION

This work consists of providing one or more courses of aggregate on a prepared surface.

2. MATERIALS

Materials shall conform to the following sections found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition:

A. **Subbase, Base Course, Gravel Cushion, and Gravel Surfacing** shall conform to the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 882. Granular additives (sand, rock, etc.) may be necessary to produce material of the type specified.

B. **Clay Binder**, when required for gravel surfacing, shall conform to the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 883.

C. **Subbase, Salvaged; Base Course, Salvaged; Gravel Cushion, Salvaged; and Gravel Surfacing, Salvaged** shall conform to the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 884.

D. **Crushed Concrete, Ballast:**

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 260.

4. METHOD OF MEASUREMENT

A. **Subbase; Subbase, Salvaged** will be measured to the nearest 0.1-ton.

B. **Subbase, Install Only** will be measured to the nearest 0.1-ton.

C. **Base Course; Base Course, Salvaged** will be measured to the nearest 0.1-ton.

D. **Base Course, Install Only** will be measured to the nearest 0.1-ton.
E. **Gravel Cushion; Gravel Cushion, Salvaged** will be measured to the nearest 0.1-ton.

F. **Gravel Surfacing** will be measured to the nearest 0.1-ton. This also includes the clay binder.

G. **Gravel Surfacing, Salvaged** will be measured to the nearest 0.1-ton.

H. **Crushed Concrete, Ballast** will be measured to the nearest 0.1-ton.

5. **BASIS OF PAYMENT**

A. **Subbase; Subbase, Salvaged** will be paid for at the contract unit price per ton. Payment will be full compensation for furnishing and placing materials, labor, equipment, test strips (if required), and all incidentals required.

B. **Subbase, Install Only** will be paid for at the contract unit price per ton. Payment will be full compensation for placing materials, labor, equipment, test strips (if required, and all incidentals required.

C. **Base Course; Base Course, Salvaged** will be paid for at the contract unit price per ton. Payment will be full compensation for furnishing and placing materials, labor, equipment, test strips (if required), and all incidentals required.

D. **Base Course, Install Only** will be paid for at the contract unit price per ton. Payment will be full compensation for placing materials, labor, equipment, test strips (if required, and all incidentals required.

E. **Gravel Cushion; Gravel Cushion, Salvaged** will be paid for at the contract unit price per ton. Payment will be full compensation for furnishing and placing materials, labor, equipment, test strips (if required), and all incidentals required.

F. **Gravel Surfacing; Gravel Surfacing, Salvaged** will be paid for at the contract unit price per ton. Payment will be full compensation for furnishing and placing materials, labor, equipment, test strips (if required), and all incidentals required.

G. **Crushed Concrete, Ballast** will be paid for at the contract unit price per ton. Payment will be full compensation for furnishing and placing materials, labor, equipment, test strips (if required), and all incidentals required.

If roadway shaping is required, and a bid item is not provided, payment for the granular material items will be full compensation for necessary shaping work.

**END OF GRANULAR BASES AND SURFACING**
1. **DESCRIPTION**

   Full depth reclamation (FDR) shall consist of processing and blending the asphalt mix and granular material, placing, watering, shaping and compacting the material to the typical section.

2. **MATERIALS**

   The asphalt mix and granular material shall conform to the South Dakota Department of Transportation ‘Standard Specification for Roads and Bridges’ 2015 Edition section 884.

3. **CONSTRUCTION REQUIREMENTS**

   Shall be the same as those in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 280.

4. **METHOD OF MEASUREMENT**

   FDR will be measured to the nearest square yard.

5. **BASIS OF PAYMENT**

   FDR will be paid for at the contract price per square yard inclusive of all costs for processing, blending, placing, shaping, compacting, equipment, test strips, labor and incidentals necessary to satisfactorily complete the work.

   **END OF FULL DEPTH RECLAMATION (FDR)**
1. **DESCRIPTION**

This work consists of cleaning the roadway surface, tack coat application, and the placement of a hot plant-mix surface with a bituminous paver over the existing surface.

2. **MATERIALS**

   **A. Tack Coat:** Tack coat shall be emulsified asphalt, SS-1H or CSS-1h

   **B. Asphalt Binder:** Asphalt binder shall be PG58-28 or PG64-22

   The Contractor shall perform the asphalt concrete mix designs and furnish the job mix formulas to the Engineer prior to the placement of any asphalt pavement. The design shall meet the following specifications for medium volume traffic:

<table>

**If the percent passing the 1/2-inch sieve is greater than or equal to 90 percent, the mix shall be considered 1/2-inch nominal maximum size. If the percent passing the 1/2-inch sieve is less than 90 percent, the mix shall be considered 3/4-inch nominal maximum size.**

**Hydrated lime shall be used to meet the moisture sensitivity requirement of the mix. Hydrated lime will not be required if the moisture sensitivity requirements are met without the addition of hydrated lime.**

***Manufactured fines shall be manufactured solely from material retained on the 3/4-inch sieve, unless the aggregate material is produced from a ledge rock source.***

Once the job mix formula is submitted, the mix must be within the following tolerances:

3. CONSTRUCTION REQUIREMENTS

   A. Tests: The Contractor shall furnish, at minimum, one complete set of test results to verify the materials meet the parameters and requirements in item 2. If any test fails, the Contractor shall immediately make the appropriate adjustments in the production of the mix and/or the placement. Another complete set of test results shall then be furnished.

   B. The City reserves the right to limit the number of streets closed to traffic and the work schedule. The purpose is to close no more than can be completed in 1-day and also to minimize inconvenience to the public, while providing for the Contractor’s efficient operation. The Contractor must provide a work schedule to the Engineer on or before the preconstruction meeting. The Contractor and Engineer must agree on the schedule before work may commence.

   C. The area to be paved shall be cleaned by brooming prior to applying the tack coat. The rate of application shall be such that approximately 0.04-gallons of bitumen residue are applied per square yard. Tack coat shall be applied only to that surface on which the overlay can be completed in the same day.
D. All mixed material shall be delivered to the finishing machine in time to permit completion of spreading, finishing and compacting during the specified working hours. The mixture shall be placed on the road at a temperature of 250 to 300° F.

4. METHOD OF MEASUREMENT

Asphalt Pavement shall be measured in tons of mixture placed and compacted. This item shall include the design, production and placement of the mixture; the preparation of the base; the tack coat and any other incidentals that are necessary. Weight tickets shall be furnished to the Inspector at the end of each day.

5. BASIS OF PAYMENT

Asphalt Pavement shall be paid for at the contract unit price bid per ton, which price shall be full compensation for furnishing all materials, labor, equipment, tools, supplies and incidentals necessary to complete the work.

END OF ASPHALT PAVEMENT
3100 - FOG AND FLUSH SEAL COATS

1. DESCRIPTION

This work consists of preparing and treating a prepared surface with asphalt material and sand as required.

2. MATERIALS

Materials shall conform to the following sections found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges' 2015 Edition:

A. Asphalt: Section 890.

B. Blotting Sand for Prime Coats: Section 879.

C. Sand for Flush Seal: Section 879.

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 330.

4. METHOD OF MEASUREMENT

A. Asphalt will be measured to the nearest 0.1-ton.

B. Blotting Sand for Prime will be measured to the nearest 0.1-ton.

C. Sand for Flush Seal will be measured to the nearest 0.1-ton.

5. BASIS OF PAYMENT

A. Asphalt will be paid for at the contract unit price per ton complete in place. Separate payment will not be made for water for dilution of emulsified asphalt.

B. Blotting Sand for Prime will be paid for at the contract unit price per ton complete in place. Payment will be full compensation for furnishing, installing, and all incidentals required to complete the work.

C. Sand for Flush Seal will be paid for at the contract unit price per ton complete in place. Payment will be full compensation for furnishing, installing, and all incidentals required to complete the work.

END OF FOG AND FLUSH SEAL COATS
1. **DESCRIPTION**

   This work shall consist of routing and sealing transverse and longitudinal cracks in an asphalt concrete roadway surface with the specified sealant.

2. **MATERIALS**

   The sealant shall conform to the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 871.

3. **CONSTRUCTION REQUIREMENTS**

   Shall be the same as those in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 350.

4. **METHOD OF MEASUREMENT**

   Asphalt Concrete Crack Sealing will be measured by the pound of sealant used. The manufacturer’s weights of the sealant will be accepted as the basis of measurement.

5. **BASIS OF PAYMENT**

   Asphalt Concrete Crack Sealing will be paid at the contract unit price per pound and shall be full compensation for routing, furnishing, heating, placing, and blotting the sealant. Blocking medium shall be incidental.

---

**END OF ASPHALT CONCRETE CRACK SEALING**
3300 - ASPHALT SURFACE TREATMENT

1. DESCRIPTION

The work consists of cleaning of the surface and an application of asphalt binder immediately covered by a layer of aggregate.

2. MATERIALS

A. Asphalt: Asphalt shall be one coat of RC-800R.

B. Cover Aggregate: Cover aggregate will be supplied by the City.

3. CONSTRUCTION REQUIREMENTS

Weather and Seasonal Requirements: Surface treatment operations will be permitted only during daylight hours, when conditions are dry and when wind does not adversely affect the spraying operations. Work may only be performed when the temperature is 70° F (in the shade and rising) and between May 15th and September 15th.

A. Equipment:

1) A pickup broom with an integral self-contained storage. The pickup broom must be a minimum 6-foot wide. While sweeping in curb and gutter sections, the pickup broom must have working gutter brooms.

2) Equipment for heating and applying (heating equipment and distributor) the asphalt conforming to the requirements in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 330.3.C.

3) A self propelled aggregate spreader, with positive controls capable of depositing the required quantity of aggregate uniformly over the full width of the asphalt application.

4) A self-propelled pneumatic smooth tire roller capable of completely covering a width of 60-inches and furnish a minimum uniform rolling weight of 250-pounds per inch.

5) Loader to load chips.

6) Truck to haul to spreader.

B. Construction Method:

1) The area to be chipped shall be cleaned by sweeping prior to applying the asphalt. Appurtenances immediately adjacent to the surface to be treated shall be protected from the splatter of asphalt. The Contractor shall repair any damage to the satisfaction of the Engineer at no additional cost. All manholes and inlet grates shall be covered prior to sealing. The rate of application shall be 0.3-gallons of RC-800R asphalt per square yard. The asphalt shall be placed at a temperature of 260° F or above.

2) Prior to applying chips the City may require that the Contractor prove that the chip spreader is
capable of spreading chips at the required rate. This will be done by placing a tarp measuring one square yard on the ground and driving the chip spreader over the tarp while spreading chips. The tarp will then be weighed to determine the application rate.

3) Chips must be applied as soon as possible after the application of the asphalt at a rate of 23-pounds per square yard. The chips shall be rolled and after rolling the street shall be opened to traffic. The City of Vermillion shall sweep the excess chips.

C. Traffic Control:

1) Contractor shall supply 2 flaggers when work is in progress.

2) Contractor shall give the City of Vermillion 1-week notice before starting the project for placement of "No Parking" signs and notices.

4. METHOD OF MEASUREMENT

Chip Seal shall be measured in square yards. This item shall include the RC-800R, placement of the RC-800R and chips, sweeping of the base, covering and uncovering manholes and inlet grates and flagging.

5. BASIS OF PAYMENT

Chip Seal shall be paid for at the contract unit price bid per square yard for chip seal, which price shall be full compensation for furnishing all materials, labor, equipment, tools, supplies and incidentals necessary to complete the work.

END OF ASPHALT SURFACE TREATMENT
1. **DESCRIPTION**

   The work consists of cold milling a portion of the existing asphalt concrete surface course and hauling and stockpiling the removed material.

2. **MATERIALS**

   Cold milled asphalt concrete material shall conform to the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 884.

3. **CONSTRUCTION REQUIREMENTS**

   Shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 332.

4. **METHOD OF MEASUREMENT**

   Cold Milling Asphalt Concrete will not be measure. Plans quantity will be used. If changes from the plan quantity are ordered these areas will be measure and the plan quantity appropriately adjusted.

5. **BASIS OF PAYMENT**

   Cold Milling Asphalt Concrete will be paid at the contract unit price per square yard. Payment will be full compensation for milling, removing, hauling, stockpiling, processing or crushing the cold milled material, brooming, equipment, labor, and all incidentals required.

END OF COLD MILLING ASPHALT CONCRETE
1. DESCRIPTION

This work consists of constructing Portland Cement Concrete Pavement on prepared surfaces.

2. MATERIALS

Materials shall conform to the following sections found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges' 2015 Edition:

A. Fly Ash: Sections 605 and 753.

B. Cement: Section 750 (only Type II).

C. Admixtures: Sections 751 and 752.

D. Water: Section 790.

E. Fine Aggregate: Section 800.

F. Coarse Aggregate: Section 820.

G. Curing Materials: Section 821.

H. Joint Filler: Section 860.

I. Joint Sealant: Section 870.

J. Dowel Bar Assemblies: Section 1010.

K. Reinforcing Steel: Section 1010.

Epoxy Resin Adhesive shall be of the type intended for horizontal applications, and shall conform to the requirements of ASTM C881, Type IV, Grade 3 (equivalent to AASHTO M235, Type IV, Grade 3) Class A, B, or C. The minimum gel time shall be 5-minutes.

Concrete shall meet the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition specifications for Class A40 concrete with course aggregate consisting of crushed quartzite.

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 380.

4. METHOD OF MEASUREMENT

A. PCC Pavement will be measured to the nearest 0.1 square yard.
B. **PCC Fillet** will be measured to the nearest 0.1 square yard.

C. **PCC Approach** will be measured to the nearest 0.1 square yard.

D. **Dowel Bar Assemblies** will be measured by the actual number of bars furnished and installed.

E. **Insert Steel Bar in PCC Pavement** will be measured by the actual number of steel bars furnished and installed. The Contractor shall insert the steel bars into drilled holes in the existing concrete pavement.

5. **BASIS OF PAYMENT**

A. **PCC Pavement** will be paid for at the contract unit price per square yard. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor equipment, and all incidentals necessary. Payment will also be full compensation for trimming and water used to moisten the subgrade ahead of the paver and curing concrete.

B. **PCC Fillet** will be paid for at the contract unit price per square yard. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor equipment, and all incidentals necessary. Payment will also be full compensation for trimming and water used to moisten the subgrade ahead of the paver and curing concrete.

C. **PCC Approach** will be paid for at the contract unit price per square yard. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor equipment, and all incidentals necessary. Payment will also be full compensation for trimming and water used to moisten the subgrade ahead of the paver and curing concrete.

D. **Dowel Bar Assemblies** will be paid for at the contract unit price per each dowel bar. Payment will be full compensation for labor, materials, equipment, and all incidentals necessary to furnish and install the assemblies.

E. **Insert Steel Bars in PCC Pavement** will be paid for at the contract unit price per each steel bar. Payment will be full compensation for labor, materials, equipment, and all incidentals necessary to furnish and install the steel bar.

END OF PORTLAND CEMENT CONCRETE PAVEMENT
1. DESCRIPTION

This work consists of filling existing voids under PCC pavement by drilling injection holes and pumping a cement/fly ash grout under the pavement slab.

2. MATERIALS

A. Design Mix: The design mix for grout shall conform to the following proportions by absolute volume:

   1 Part Portland cement
   3 Parts fly ash
   Water to achieve the specified fluidity

   Fluidity of the grout when measured by a flow cone in accordance with ASTM C939 shall have a time of efflux between 9 and 15 seconds.

   The Contractor shall submit for approval, materials proposed for use. The submittals shall include mill certification for cement, physical and chemical analysis for fly ash, and tests of the grout slurry by a South Dakota Department of Transportation approved testing laboratory. Tests shall show one, three, and seven day strengths, flow cone times, shrinkage and expansion observed, and time of initial set. The seven day strength shall be at least 600-psi as measured in accordance with ASTM C942. As an alternate, standard 6-inch diameter by 12-inch high water tight concrete cylinder molds may be used to determine seven day strength. When the cylinder molds are used, the strength shall be 700-psi minimum.

B. Cement: Shall conform to Section 750 (only Type 1 or 2).

C. Water: Shall conform to Section 790.

D. Fly Ash: Shall conform to Section 753.

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 391.

4. METHOD OF MEASUREMENT

A. PCC Drill Holes will be measured per each (only accepted holes will be paid for). The holes drilled after the deflection testing will not be included for payment.

B. PCC Pavement Undersealing will be measured to the nearest cubic foot. Portland cement will be the only material measured for payment. One bag of cement (94-pounds) shall equal one cubic foot of PCC pavement undersealing.

C. Deflection Testing will be measured per each test location. Testing before and after undersealing at the same joint will be measured as separate locations. If the deflection testing after undersealing is in excess of 0.010-inches further undersealing will be required.
Should the testing, after the undersealing is performed, indicate a need for further undersealing at that joint, all addition testing at that joint will be at no cost to the City.

5. BASIS OF PAYMENT

A. PCC Drill Holes will be paid for at the contract unit price per each. Payment will be full compensation for all materials, equipment, tools, and incidentals required to drill, plug and seal the holes after the undersealing is completed.

B. PCC Pvmt Undersealing will be paid for at the contract unit price per cubic foot. Payment will be full compensation for all materials, including fly ash and water, labor, equipment, tools, and incidentals required.

C. Deflection Testing will be paid for at the contract unit price per each test location. Payment will be full compensation for all materials, equipment, tools, and incidentals required.

END OF UNDERSEALING
1. DESCRIPTION

This work consists of hydraulic pressure jacking PCC pavement to correct the pavement profile. Jacking is accomplished by drilling injection holes and pumping a cement/fly ash slurry or liquid polyurethane (foam) under the slab.

2. MATERIALS

A. Cement: Shall conform to Section 750 (only Type 1 or 2).

B. Fly Ash: Shall conform to Section 753.

C. Water: Shall conform to Section 790.

D. Design Mix: The design mix for grout shall conform to the following proportions by absolute volume:

1 Part Portland cement
3 Parts fly ash
Water to achieve the specified fluidity

Fluidity of the grout when measured by a flow cone in accordance with ASTM C939 shall have a time of efflux between 16 and 36 seconds. During the initial injection at each hole an efflux time between 9 and 15 seconds will be permitted. The use of material with an efflux time between 9 and 15 seconds shall be discontinued prior to movement of the pavement. The Contractor shall be required to perform this test prior to placing the material.

The Contractor shall submit for approval, materials proposed for use. The submittals shall include mill certification for cement, physical and chemical analysis for fly ash, and tests of the grout slurry by a South Dakota Department of Transportation approved testing laboratory. Tests shall show one, three, and seven day strengths, flow cone times, shrinkage and expansion observed, and time of initial set. The seven day strength shall be at least 600-psi as measured in accordance with ASTM C942. As an alternate, standard 6-inch diameter by 12-inch high water tight concrete cylinder molds may be used to determine seven day strength. When the cylinder molds are used, the strength shall be 700-psi minimum.

E. Jacking Foam: Water blown formulation of high-density polyurethane. The high density, closed cell polyurethane shall be hydrophobic and shall exhibit the following physical characteristics and properties:

<table>
<thead>
<tr>
<th>DENSITY, LB/CU.FT (ASTM D1622)</th>
<th>COMRESSIVE STRENGTH (ASTM D1621)</th>
</tr>
</thead>
<tbody>
<tr>
<td>3.0</td>
<td>40 psi</td>
</tr>
<tr>
<td>3.5</td>
<td>50 psi</td>
</tr>
<tr>
<td>4.0</td>
<td>60 psi</td>
</tr>
<tr>
<td>6.0</td>
<td>110 psi</td>
</tr>
</tbody>
</table>

The polyurethane foam shall have a free rise density of 3.0 to 3.2 lbs/cu.ft., with a minimum compressive strength of 40-psi. The material shall be resistant to oils, gasoline and most solvents.
The high-density polyurethane formulation shall reach 90% of full compressive strength within 15-minutes from injection.

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 392.

4. METHOD OF MEASUREMENT

A. PCC Pavement Jacking Slurry will be measured to the nearest cubic foot. Portland cement will be the only material measured for payment. One bag of cement (94-pounds) shall equal one cubic foot of PCC pavement jacking slurry.

B. PCC Pavement Jacking Foam will be measured to the nearest pound.

5. BASIS OF PAYMENT

A. PCC Pavement Jacking Slurry will be paid for at the contract unit price per cubic foot. Payment will be full compensation for all materials, including fly ash, water, labor, equipment, tools, and incidentals required.

B. PCC Pavement Jacking Foam will be paid for at the contract unit price per pound. Payment will be full compensation for all materials, including high-density polyurethane foam, labor, equipment, tools, and incidentals required.

END OF PAVEMENT JACKING
1. DESCRIPTION

This work consists of constructing concrete curb and gutter.

2. MATERIALS

Materials shall conform to the following sections found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition:

A. Concrete: Section 460 (only Class A40).

B. Expansion Joint Filler: Section 860.

C. Curing Compound: Section 821.

D. Reinforcing Steel: Section 1010.

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 650.

4. METHOD OF MEASUREMENT

Concrete Curb and Gutter, 6-inches will be measured to the nearest foot. Measurement for concrete curb and gutter will be along the flowline of the gutter. Deductions will not be made for lengths of drop inlets, grates, etc., or for the tapering of curb for entrances. Separate measurements will be made for the various types specified and constructed.

5. BASIS OF PAYMENT

Concrete Curb and Gutter, 6-inches will be paid for at the contract unit price per foot.

Payment will be full compensation for furnishing materials, the expansion joints, steel reinforcement, forms bracing, excavation, backfill, labor, equipment, and incidental necessary.

END OF CURB AND GUTTER
1. DESCRIPTION

This work consists of constructing concrete sidewalks on a prepared subgrade.

2. MATERIALS

Materials shall conform to the following sections found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition:

A. Concrete: Section 460 (only Class A40 with course aggregate consisting of crushed quartzite).

B. Expansion Joint Filler: Section 860.

C. Curing Compound: Section 821.

Cushion Material shall consist of rock, gravel, or sand, crushed or screened to eliminate material retained on a ¾-inch sieve. The material shall be free from roots, sod, and lumps of dirt. Not more than 25% by weight shall pass a #200 sieve.

3. CONSTRUCTION REQUIREMENTS

The foundation shall be excavated, shaped, and compacted to a firm, uniform bearing surface. Unsuitable foundation material shall be removed and replaced as directed. The foundation shall be thoroughly moistened immediately prior to placing concrete.

Cushion material shall be placed to the depth specified and satisfactorily compacted.

Forms shall be made of wood not less than 2-inches nominal thickness or of steel of equal rigidity. Flexible strips may be used on curves. The forms shall be securely held to line and grade and shall not deviate more than 1/8-inch from an accurate template 10-foot in length. The forms shall remain in place until the concrete has hardened to the point that no damage will be done to the concrete during the removal. Damage to the concrete as the result of form removal shall be repaired by the Contractor at no additional expense to the City.

Joint and edging tools shall have an approved ¼-inch radius.

Immediately after the water sheen has disappeared the concrete shall be brushed or broomed to slightly roughen the surface and remove tool marks.

Contraction joints shall be placed at intervals that will provide square sections. The contraction joints shall be formed by a grooving tool or sawing to a depth of at least 1/4 the thickness of the sidewalk. A longitudinal joint may be required by the Engineer on sidewalks 8-feet or greater in width.

Expansion joints shall be constructed of at least ½-inch Preformed Expansion Joint Filler, or as specified on the plans, at a maximum spacing of 50-feet or at the locations and of the dimensions specified on the plans. When adjacent to buildings, provide a double thickness of Preformed Expansion Joint Filler at the back of the sidewalk. Place ½-inch Preformed Expansion Joint Filler longitudinally along the backface of the curb and gutter. All other obstructions will require ½-inch Preformed Expansion Joint Filler, as directed by the
Engineer. The expansion joint filler shall be placed the full depth of the sidewalk.

Sidewalks shall be protected and cured in accordance with the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 460.3, except the minimum curing time shall be 72-hours.

Concrete sidewalks with slopes exceeding the design slopes shall be removed and replaced at the Contractor's expense. After the curing period, the area adjacent to new sidewalk shall be filled to the required elevation with suitable material. The material shall be compacted to the same degree as the adjacent embankment or ground surface.

4. **METHOD OF MEASUREMENT**

   Sidewalk will be measured to the nearest tenth of a square yard.

5. **BASIS OF PAYMENT**

   Sidewalk will be paid for at the contract unit price per square yard.

   Payment will be full compensation for excavation other than removal of existing sidewalk.

   Payment will be full compensation for labor, equipment, tools, backfilling, furnishing and placing materials, including granular material, preformed expansion joint material and incidentals necessary, including disposal of excavation and discarded materials.

   **END OF SIDEWALKS**
1. DESCRIPTION

This work consists of constructing Portland Cement Concrete Pavement on prepared surfaces for alleyways and parking lots.

2. MATERIALS

Materials shall conform to the following sections found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition:

A. Cement: Section 750 (only Type II).
B. Admixtures: Sections 751 and 752.
C. Water: Section 790.
D. Fine Aggregate: Section 800.
E. Coarse Aggregate: Section 820.
F. Reinforcing Steel: Section 1010.
G. Joint Filler: Section 860.
H. Joint Sealant: Section 870.
I. Curing Materials: Section 821.
J. Dowel Bar Assemblies: Section 1010.
K. Fly Ash: Sections 605 and 753.

Epoxy Resin Adhesive shall be of the type intended for horizontal applications, and shall conform to the requirements of ASTM C881, Type IV, Grade 3 (equivalent to AASHTO M235, Type IV, Grade 3) Class A, B, or C. The minimum gel time shall be 5-minutes.

Concrete shall meet the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition specifications for Class A40 concrete with course aggregate consisting of crushed quartzite.

3. CONSTRUCTION REQUIREMENTS

Concrete shall be unloaded and deposited uniformly across the subgrade or subbase as close as possible to its final position.

At a minimum, the use of a self-propelled vibratory screed is required. The screed shall run on forms.

With the exception of the above items, the rest of the Construction requirements shall be the same as those
in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 380.

4. METHOD OF MEASUREMENT

PCC Pav, Alley, ParkingLots will be measured to the nearest 0.1 square yard.

Insert Steel Bar in PCC Pav will be measured by the actual number of steel bars furnished and installed. The Contractor shall insert the steel bars into drilled holes in the existing concrete pavement.

5. BASIS OF PAYMENT

PCC Pav, Alley, Parking Lots will be paid for at the contract unit price per square yard.

Payment will be full compensation for furnishing all materials (including reinforcing steel), labor equipment, and all incidentals necessary. Payment will also be full compensation for trimming and water used to moisten the subgrade ahead of the paver and curing concrete.

Insert Steel Bars in PCC Pav will be paid for at the contract unit price per each steel bar. Payment will be full compensation for labor, materials, equipment, and all incidentals necessary to furnish and install the steel bar.

END OF PCC PAVEMENT FOR ALLEYS AND PARKING LOTS
4600 – RETROFIT TIE BAR

1. DESCRIPTION

This work consists of drilling holes and placing tie bars perpendicular across cracks or joints in concrete pavement.

2. MATERIALS

Materials shall conform to the following sections found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition:

A. Reinforcing Steel: Section 1010.

B. Epoxy Resin Adhesive shall be of the type intended for horizontal applications, and shall conform to the requirements of ASTM C881, Type IV, Grade 3 (equivalent to AASHTO M235, Type IV, Grade 3) Class A, B, or C. The minimum gel time shall be 5-minutes.

3. CONSTRUCTION REQUIREMENTS

A. Stitching and Drilled Tie Bars: The Contractor shall install No. 5 epoxy coated deformed tie bars into drilled holes in the existing concrete pavement. An epoxy resin adhesive must be used to anchor the steel bar in the drilled hole. The drill used may be rig mounted or hand held with the use of a drill template. The equipment needs to be reviewed prior to construction by Engineer and/or the Street Superintendent.

The steel bars shall be cut to the specified length by sawing and shall be free from burring or other deformations. Shearing will not be permitted.

The diameter of the drilled holes in the existing concrete pavement for the steel bars shall not be less than 1/8-inch nor more than 3/8-inch greater than the overall diameter of the steel bar. The holes shall be drilled at an angle alternating from opposite sides of the joint to produce a cross stitching pattern. The drilled holes shall be blown out with compressed air using a device that will reach to the back of the hole to ensure that all debris or loose material has been removed prior to epoxy injection. Damage to pavement shall be repaired to the satisfaction of the Engineer at the Contractor’s expense.

Mix the epoxy resin as recommended by the manufacturer and apply by an injection method approved by the Engineer. If an epoxy pump is utilized, it shall be capable of metering the components at the manufacturers designated rate and be equipped with an automatic shut-off. The pump shall shut-off when any of the components are not being metered at the designated rate. Fill the drilled holes sufficiently with epoxy prior to the insertion of the tie bar such that the epoxy will be level with the top of the concrete pavement after insertion of the tie bar. Rotate the steel bar during installation to eliminate voids and ensure complete bonding of the bar. Insertion of the bars by the dipping method will not be allowed. The top of the drilled hole shall be filled with epoxy or excess epoxy removed such that the epoxy is level with the existing pavement.

No bars shall be installed within 9-inches of an existing transverse contraction joint. Any bars not functioning or damaged shall be repaired or replaced at the Contractor’s expense.

4. METHOD OF MEASUREMENT

A. Retrofitting Tie Bars (Stitching) will be measured per each bar installed.

B. Drilled Tie Bars will be measured per each bar installed.
5. BASIS OF PAYMENT

A. **Retrofitting Tie Bars (Stitching)** will be paid for at the contract unit price per each. Payment will be full compensation for epoxy, tie bars, drilling holes, removal of debris or loose material, applying the adhesive, installing the tie bars into the holes and all other items incidental to the installation of the tie bars.

B. **Drilled Tie Bars** will be paid for at the contract unit price per each. Payment will be full compensation for epoxy, tie bars, drilling holes, removal of debris or loose material, applying the adhesive, installing the tie bars into the holes and all other items incidental to the installation of the tie bars.

END OF RETROFIT TIE BAR
1. **DESCRIPTION**

   This work consists of furnishing and installing flowable fill, also known as controlled density fill or ‘K-Crete’.

2. **MATERIALS**

   Materials shall conform to the following sections found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition:

   A. **Cement**: Section 750. Type I, Type II, Type III, or Type IV cement may be used, unless otherwise specified.

   B. **Admixtures**: Controlled low strength material (CLSM) performance additive (foaming admixture) as listed on the South Dakota Department of Transportation approved products list.

   C. **Water**: Section 790.

   D. **Fly Ash**: Section 753, Class C.

   E. **Fine Aggregate** shall be natural sand consisting of mineral aggregate particles conforming to the following gradation requirements:

   1) Passing 3/8-Inch Sieve 100%
   2) Passing No. 200 Sieve 0-10%

3. **CONSTRUCTION REQUIREMENTS**

   The mix shown above is designed to produce a minimum compressive strength of 100-psi. The City Engineer may allow adjustments to the proportion of water at the site to provide the necessary consistency of the mix.

   The flowable fill shall be contained within the required limits with sandbags or other methods approved by the City Engineer.

   The Contractor shall prevent flotation or movement of pipes, and structures, due to the buoyant force from the flowable fill until the flowable fill hardens. Overlying surfacing materials shall not be placed sooner than 4-hours after placement of flowable fill.

4. **METHOD OF MEASUREMENT**

   A. **Flowable Fill** will be measured per cubic yard.

5. **BASIS OF PAYMENT**
A. Flowable Fill will be paid for at the contract unit price per cubic yard. Payment will be full compensation for furnishing and installing flowable fill. This includes sandbags, labor, materials, equipment and incidentals necessary to complete the work.

END OF FLOWABLE FILL
5000 - PAVEMENT MARKING

1. DESCRIPTION

This work consists of furnishing and applying pavement marking materials and surface grooving of Portland cement pavement or asphalt concrete pavement.

2. MATERIALS

Materials shall conform to the following sections found in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition:

B. Paint: Section 980.

C. Glass Beads: Section 981.

3. CONSTRUCTION REQUIREMENTS

Shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2015 Edition section 633.

4. METHOD OF MEASUREMENT

A. Cold Applied Plastic Pavement Marking of the width and color specified will be measured by the foot.

B. Cold Applied Plastic Pavement Marking Arrows will be measured by count of each type specified.

C. Cold Applied Plastic Pavement Marking Messages will be measured by count of each complete word specified.

D. Cold Applied Plastic Pavement Marking Areas will be measured to the nearest square foot.

E. Pavement Marking Paint and Beads will be measured to the nearest ½ gallon of paint.

F. Grooving for Pavement Marking Tape will either be measured to the nearest foot, along the length of the groove for the width of grooving specified in the plans. Grooving for words and messages will be measured by the word. Grooving for arrows will measured by the each and miscellaneous grooving will measured to the nearest square foot.

5. BASIS OF PAYMENT

A. Cold Applied Plastic Pavement Marking will be paid for at the contract unit price per foot for each width specified.

B. Cold Applied Plastic Pavement Marking Arrows will be paid for at the contract unit price per each for each type specified.
C. Cold Applied Plastic Pavment Marking Messages will be paid for at the contract unit price per each word specified.

D. Cold Applied Plastic Pavment Marking Areas will be paid for at the contract unit price per square foot.

E. Pavment Marking Paint and Beads will be paid for at the contract unit price per gallon for each color specified. Payment will be full compensation for furnishing paint and beads and for labor, equipment, and incidentals necessary.

F. Grooving for Pavment Marking Tape will be paid for at the contract unit price per foot for the width of groove specified or the contract unit price per word, per arrow, each or square foot as required by the respective contract item. Payment will be full compensation for equipment, labor, materials, and all incidentals required.

END OF PAVEMENT MARKING
6000 - STORM SEWER SYSTEM

1. DESCRIPTION

   This work consists of furnishing and installing concrete pipe, manholes and drop inlets.

2. MATERIALS

   Materials shall conform to the following sections found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition:

   A. Concrete: Section 462 (only M6).
   B. Castings: Castings will be provided by the City.
   C. Steel Reinforcement: Section 1010.
   D. Curing Compound: Section 821.
   E. Precast Units shall conform to AASHTO M 199.
   F. Mortar shall consist of one part Portland cement and two parts mortar sand conforming to sections 750 and 810 respectively. As an alternate, a commercially available grout conforming to section 460.3.S may be used.
   G. Reinforced Concrete Pipe shall conform to Section 990. Unless otherwise specified on the drawings or in the specifications, RCP class III pipe shall be furnished.
   H. Stabilization Rock shall consist of 1 ½-inch maximum size crushed aggregate shall be used as directed by the Engineer for proper bedding of the pipe in wet and unstable areas.

3. CONSTRUCTION REQUIREMENTS

   A. PIPE CONSTRUCTION

      1) Excavation: The trench shall be dug to the alignment and depth required and only so far in advance of the pipe as the Engineer will permit. In general, the Contractor shall not leave more than 100-feet of trench open at one time and all trenches shall be backfilled prior to the end of the day’s work.

      Care shall be taken to maintain vertical trench walls in the pipe zone. The trench width shall not be less than 12-inches or more than 24-inches greater than the outside diameter of the pipe. The trench walls may be backsloped from a point level with the top of the pipe.

      All pipes must be bedded in ¾-inch crushed quartzite. The bedding material must extend 3-inches below the pipe and 1/6 of the pipe diameter above the bottom of the pipe.

      Ledge rock, boulders and large stones shall be removed to provide a clearance of at least 4-inches on all sides of the pipe.

      2) Trench Bracing and Sheetin: Trenches shall be securely held by bracing and sheeting which may be removed when the backfill level has reached the elevation necessary to protect the pipe work and adjacent property. Trenches shall be so braced that personnel may work therein safely and efficiently. In the event that sheeting is not considered necessary, the Contractor shall assume all liability for all damages to property or injury to workmen or other persons, which may occur
because of such omission.

3) **Protection of Structures**: The Contractor shall, at his own expense, shore up and otherwise protect any building or other structure which may, in the opinion of the Engineer, be endangered during the work, and the Contractor shall restore all structures, culverts, fences, walls or other properties disturbed during the work to a condition similar or equal to that existing before their operation.

4) **Water**: The contractor shall keep the trenches free from water at all times as work progresses. Water shall not be permitted to rise in un-backfilled trenches after the pipe has been laid.

5) **Pipe Laying**: The pipe shall be carefully laid to the line and grade shown on the drawings using a laser beam to obtain a uniform grade and line. All pipes shall be laid with the bells upgrade. Any discrepancy or irregularity of line and grade stakes shall be immediately called to the attention of the Engineer and pipe laying shall be discontinued until the cause of the discrepancy is found and corrected and the Engineer gives permission to continue.

As construction progresses, the pipe shall be cleaned of any foreign material enter the pipe. When the work is stopped, the exposed end of the pipe shall be plugged to prevent the entrance of dirt, animals or other foreign objects. The interior of all pipes shall be clean and free of foreign material at the time of acceptance by the owner.

6) **Joints**: Joints shall be effectively protected against infiltration of backfill soil by providing a full circumferential wrap with a 2-foot wide strip of drainage fabric around the perimeter of the pipe. The drainage fabric shall be centered over the joint. The Engineer shall require the use of construction adhesives if the Contractors method of installation does not secure the drainage fabric over the center of the joint while placing backfill.

When the plans require the use of rubber gaskets at joints they shall be installed according to manufacturer instructions.

7) **Backfill**: Backfill around the pipe and fittings shall be thoroughly tamped, by hand, to a level 12-inches above the pipe using selected materials containing no stones larger than 2-inches in diameter. At street intersections and at other points where paving, walks, curb and gutter or other permanent improvements have been made or are proposed within the foreseeable future, as shown on the plans or in the specifications, backfill shall be placed in successive layers so as to provide a degree of compaction equal to 95% of the maximum density as determined by the Standard Proctor Method (AASHTO 799). In all other areas, the compaction above the level of 12-inches over the top of the pipe shall be at least equal to the surrounding soil.

All existing gravel surfaces shall be replaced to the same thickness as the existing surface or 6-inches of crushed aggregate base course, whichever is greater.

Unless otherwise specified in the specifications, any surplus material remaining shall become the property of the Contractor and it shall be his duty to dispose of it at his own expense.

8) **Protecting Underground and Surface Structures**: Temporary supports, adequate protection and maintenance of all underground and surface utility structures, drains, sewers, house and service connections for both sewer and water and other obstructions encountered in the progress of the work shall be furnished by the Contractor at his own expenses under the direction of the Engineer.

Whenever possible, all existing utility structures or branch connections leading therefrom will be located in advance of the excavation of the trench and properly marked. The Contractor shall not cut any existing utility lines unless it is determined by the Engineer that it must be done to install the
new sewer pipes. All utility lines that are cut or broken by the Contractor without the approval of the Engineer shall be repaired or replaced by the Contractor at his own expense.

9) **Removal of Trees**: The Contractor shall include in his bid for furnishing and installing the sewer pipe the cost of removing and disposing, as directed by the Engineer, such trees that interfere with the sewer construction.

10) **Extras**: No extra allowance will be made for rock, water, quicksand, or other unexpected material except as covered by other bid items; and Contractors in making their bids, do so with the full understanding that the work be completed for the price named in their bid except for extras ordered, in writing, by the Engineer.

11) **Pavement Cutting**: Where storm sewer is installed in streets on which asphalt or concrete pavement exists, the pavement shall be neatly cut out in a straight line along both edges of the trench. Cutting shall be done with a concrete saw. The paving so cut will be removed, loaded and hauled to a site designated by the Engineer. Cut width of paving will be approved by the Engineer.

12) **Pavement Restoration**: Pavement repair shall present a finished surface similar to the surrounding street surface. PCC pavement shall be repaired to the same thickness and reinforcement as was existing before the pavement was cut. Asphalt pavement shall be repaired to the same thickness as the existing pavement or 4-inches, whichever is greater, properly compacted with an adequate sized roller or vibratory packer. The surface of the finished repair shall conform to the grade of the existing pavement and a depression or a hump of more than ¼-inch will not be allowed.

**B. MANHOLE CONSTRUCTION**

Concrete for cast in place manholes shall be proportioned, mixed, hauled and placed in accordance with the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2004 Edition section 460.

When the foundation for a manhole is in a new embankment, the embankment shall be constructed at least 1-foot above the footing before the foundation is prepared. The foundation shall be compacted to the same degree as specified for the adjacent embankment.

Castings shall be set in full mortar beds or secured as specified. Castings shall be set to the plan elevations.

Inlet and outlet pipe connections shall be the same size and kind and shall meet the same requirements as the pipe they connect. Pipe sections shall be flush on the inside of the structure wall and project outside for proper connection with the next pipe section. Masonry shall fit neatly and tightly around the pipe.

Upon completion and curing of the unit, the sheeting, bracing, forms, and falsework shall be removed and the excavation backfilled. Backfill shall be placed in layers not exceeding 6-inches thick and compacted to the same degree as specified for adjacent embankment.

Installations shall be finished and left in a satisfactory condition. The following specific provisions shall apply to the various types of construction:

1) **Cast in Place Concrete**: The foundation for manholes shall be thoroughly moistened immediately prior to placing concrete.
Steel reinforcement shall be placed in accordance with the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2004 Edition section 480.

Concrete shall be protected and cured in accordance with the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2004 Edition section 460. The minimum curing time shall be 72-hours. The finished surface of the concrete shall present a neat and smooth appearance.

2) **Precast Sectional Reinforced Concrete Units:** Precast manholes shall conform to the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2004 Edition section 560.

The bottom precast section shall be set in a full mortar bed, and the joints between sections and around pipes shall be filled with mortar.

3) **Adjusting Manhole Covers:** When the manhole rim and cover is to be lowered sufficiently to require reconstruction of the arch or raised more than 1-foot, or when reconstruction of existing manhole is specified without change in grade, the manhole shall be reconstructed to the extent necessary to provide the adjustment specified.

When the rim and manhole is to be lowered to an extent which does not require reconstruction of the arch or when the rim and cover are to be raised 1-foot or less, the adjustment shall be made by removing the top as necessary and setting the rim at the proper elevation on a building up concrete.

C. **INLET CONSTRUCTION**

Shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges' 2004 Edition section 670.

4. **METHOD OF MEASUREMENT**

A. **Strm Swr, ≤8-ft** will be measured in feet, to the nearest tenth, by the Engineer. The length will be obtained by measuring from the center of structure to the center of structure. This is only for pipe buried 8-feet or less (invert to top of ground).

B. **Strm Swr, >8-ft** will be measured in feet, to the nearest tenth, by the Engineer. The length will be obtained by measuring from the center of structure to the center of structure. This is only for pipe buried more than 8-feet (invert to top of ground).

C. **Strm Stabilization Rock** will be measured in linear feet of crushed rock compacted in place to the nearest tenth. The rock shall be 1 ½-inch maximum size crushed aggregate.

D. **Strm Manhole, ≤8-ft** will be measured per each. Item is for storm manholes 8-feet or less in depth measured from the bottom of the floor to the top of casting.

E. **Strm Manhole, >8-ft** will be measured per each. Item is for storm manholes greater than 8-feet in depth measured from the bottom of the floor to the top of casting.

F. **Adjust Strm Manhole** will be measured as a unit for each manhole being adjusted.

G. **Replace Strm Manhole Covers** will be measured as a unit for each manhole being replaced.

H. **Connect to Exist. Strm Manhole** will be measured as a unit for each connection being performed.

I. **Inlet, Type V, ≤8-ft** will be measured per each. Item is for inlets 8-feet or less in depth measured from
the bottom of the floor to the flowline of the grate.

J. **Inlet, Type V, >8-ft** will be measured per each. Item is for inlets greater than 8-ft in depth measured from the bottom of the floor to the flowline of the grate.

K. **Inlet, Type B, ≤8-ft** will be measured per each. Item is for inlets 8-feet or less in depth measured from the bottom of the floor to the flowline of the grate.

L. **Inlet, Type B, >8-ft** will be measured per each. Item is for inlets greater than 8-ft in depth measured from the bottom of the floor to the flowline of the grate.

M. **Adjust Inlet, Type V** will be measured per each inlet adjusted.

N. **Adjust Inlet, Type B** will be measured per each inlet adjusted.

O. **Replace Inlet Top, Type V** will be measured per each inlet top replaced.

P. **Replace Inlet Top, Type B** will be measured per each inlet top replaced.

Q. **Connect to Exist. Inlet** will be measured per each connection being performed.

5. **BASIS OF PAYMENT**

A. **Strm Swr, ≤8-ft** will be paid for at the contract unit price per foot for furnishing the pipe, special sections, gaskets, connecting devices and coupling bands and for installing the pipe, special sections, gaskets, drainage fabric, construction adhesive, preformed mastic, connecting devices, coupling bands and bedding material.

B. **Strm Swr, >8-ft** will be paid for at the contract unit price per foot for furnishing the pipe, special sections, gaskets, connecting devices and coupling bands and for installing the pipe, special sections, gaskets, drainage fabric, construction adhesive, preformed mastic, connecting devices, coupling bands and bedding material.

C. **Strm Stabilization Rock** will be paid for at contract unit price per linear feet of crushed rock compacted in place. Payment will be full compensation for furnishing and installing the crushed aggregate.

D. **Strm Manhole, ≤8-ft** will be paid for at the contract unit price per manhole for each design furnished and accepted, inclusive of materials, labor, equipment, excavation and incidentals necessary.

E. **Strm Manhole, >8-ft** will be paid for at the contract unit price per manhole for each design furnished and accepted, inclusive of materials, labor, equipment, excavation and incidentals necessary.

F. **Adjust Strm Manhole** will be paid for at the contract unit price per each adjustment performed. Payment will be full compensation for furnishing materials, labor and equipment necessary.

G. **Replace Strm Manhole Covers** will be paid for at the contract unit price per each manhole cover replaced. Payment will be full compensation for furnishing materials, labor and equipment necessary.

H. **Connect to Exist. Strm Manhole** will be paid for at the unit price bid per each connection. Payment includes coring or cutting into the existing manhole, pipe connectors, grout and waterstop (when required).

I. **Inlet, Type V, ≤8-ft** will be paid for at the contract unit price per each. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor, equipment, and all incidentals necessary.
J. **Inlet, Type V, >8-ft** will be paid for at the contract unit price per each. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor, equipment, and all incidentals necessary.

K. **Inlet, Type B, ≤8-ft** will be paid for at the contract unit price per each. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor, equipment, and all incidentals necessary.

L. **Inlet, Type B, >8-ft** will be paid for at the contract unit price per each. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor, equipment, and all incidentals necessary.

M. **Adjust Inlet, Type V** will be paid for at the contract unit price per each. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor, equipment, and all incidentals necessary.

N. **Adjust Inlet, Type B** will be paid for at the contract unit price per each. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor, equipment, and all incidentals necessary.

O. **Replace Inlet Top, Type V** will be paid for at the contract unit price per each. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor, equipment, and all incidentals necessary.

P. **Replace Inlet Top, Type B** will be paid for at the contract unit price per each. Payment will be full compensation for furnishing all materials (including reinforcing steel), labor, equipment, and all incidentals necessary.

Q. **Connect to Exist. Inlet** will be paid for at the unit price bid per each connection. Payment includes coring or cutting into the existing inlet, pipe connectors, grout and waterstop (when required).

**END OF STORM SEWER SYSTEM**
7000 - SANITARY SEWER SYSTEM

1. DESCRIPTION

This work consists of furnishing and installing sanitary sewer pipe, sanitary sewer force main, sanitary sewer manholes and sanitary sewer services.

2. MATERIALS

A. PVC Solid Wall Gravity Sewer Pipe: PVC Solid Wall pipe and fittings shall meet the latest revision of ASTM D-3034 with Elastomeric Gasket Joints. The flow characteristics must provide a Manning ‘n’ coefficient of 0.009.

B. All pipe fittings shall have a rubber ring bell and spigot joints – the bell of which shall consist of integral wall section stiffened with 2 PVC retainer rings, which securely lock the solid cross section rubber ring into position. The sealing ring must meet ASTM D-3212 'Joints for Drain and Sewer Pipes using Flexible Elastomeric Seals.'

C. The minimum wall thickness shall be:
   1) Diameter: 4, 6, 8, 10, 12, 15
   2) Wall Thickness: 0.120, 0.180, 0.240, 0.300, 0.360, 0.437

   Providing a minimum SDR of 35 and minimum 'pipe stiffness' of F/ΔY=46-psi when measured at 5% deflection.

D. PVC Ribbed Gravity Sewer Pipe (12-inches and larger only): All ribbed PVC pipe and fittings shall meet (Non-spiral ribbed type) and UNI-BELL specification UNI-B-9. Pipe shall have a smooth interior (Manning ‘n’ coefficient of 0.009) with solid cross sectional rib exterior. Exterior ribs shall be perpendicular to the axis of the pipe to allow placement of sealing gaskets without additional cutting or machining. The rubber gasket is pre-positioned around the spigot of the pipe and is inserted into a smooth bell to provide a tight joint in compliance with ASTM D-3212. The pipe wall will be homogeneous and contain no seams. The pipe shall have a ‘pipe stiffness’ of F/ΔY=60-psi when measured at 5% deflection for sizes 12-inches to 18-inches, and 46-psi for sizes 21-inches to 30-inches.

E. PVC Corrugated Sewer Pipe (12-inches and larger only): All PVC corrugate sewer pipe and fittings shall meet the latest revision of ASTM F-949. The pipe shall have a smooth interior (Manning 'n' coefficient of 0.009). Elastomeric spigot of the seals (gaskets) shall be pre-positioned on spigot of the pipe and inserted into a smooth bell to provide a tight joint in compliance with ASTM D-3212. The pipe shall have a ‘pipe stiffness’ of F/ΔY=50-psi when measured at 5% deflection in accordance with Test Method D-2412.

F. PVC Sewer Force Main Pipe: PVC sewer force main pipe and fittings shall conform insofar as appropriate to the City Water Supply Pipeline specifications including the hydrostatic pressure testing.

G. Sanitary Sewer Manholes: All manholes shall be constructed of precast concrete, with cast iron rings and covers as shown on the drawings. Precast concrete manholes shall have concentric cones with 27-inch top opening diameter. Joints between precast manhole sections shall be sealed by installing a RAM-NEK sealing strip or approved equal. Steps are not required unless so designated on the drawings.

H. Concrete: Concrete used in the construction of manholes shall be mixed and transported in accordance with ASTM specification for ready mixed concrete, designation C-94. Concrete shall develop a compressive strength of 3,500-psi in 28-days. Any concrete, which is not plastic or workable when it
reaches the job, shall be rejected.

I. **Manhole rings and covers**: Cast iron manhole rings and covers shall be tough, close-grained gray iron, sound, smooth, clean and free from sand holes or other defects. They shall be Neenah R-1733 heavy-duty frame with platen solid lid and 2 closed pickholes or approved equal. Bid proposal will state when manhole rings and covers will be furnished by the City. The Contractor shall be responsible for loading, transporting and installation.

J. **Manhole water stop**: A rubber gasket fastened with a stainless steel band shall be installed on all plastic pipes with smooth outside surface near the center of the manhole walls.

K. **External Inflow and Infiltration Barrier**: External inflow and infiltration barriers shall be as manufactured by Sealing Systems, Inc., Wrapid Seal as manufactured by CANUSA-CPS, Cretex or approved equal. The barrier shall be a continuous band made of high quality EPDM rubber with a minimum thickness of 60-mils. Each unit shall have a 2-inch wide mastic strip on the top and bottom of the band. The mastic shall be non-hardening butyl rubber sealant, with a minimum thickness of 3/16-inch, and shall seal to the cone/top of the manhole section and over the flange of the casting.

L. **Internal Inflow and Infiltration Barrier**: Internal inflow and infiltration barriers shall be installed on all new sanitary sewer manholes, or when a sanitary sewer manhole is adjusted 4-inches or more, and where indicated on the plans or in the field. Internal inflow and infiltration barriers may be either rubber with metal bands or a low density polyethylene insert conforming to Standard Detail Drawing 5.7.17 — Manhole Internal Chimney Seal — or other internal chimney seal products as approved by the Engineer.

M. **Service connections**: Wyes for service connections shall be installed where shown on the drawings or where directed by the Engineer. Future manhole openings shall be provided as shown on the drawings. All connections, which are for future use, shall be capped with a watertight stopper as recommended by the pipe manufacturer. The ends of pipe, which enter masonry, shall be neatly cut to fit the interface of the masonry. When directed, such cutting shall be done before the pipes are built in.

All sewer taps must be inspected by the City when connecting to the mainline.

N. **Select Fill Material**: Select fill material shall be used for backfill where native material is unsuitable for use. The granular fill material shall be used as directed by the Engineer.

O. **Sanitary Sewer Bedding Material**: Sanitary sewer bedding material shall meet the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 820, size no. 1 gradation.

P. **Pipe Tracer Wire**: Pipe tracer wire shall be provided and installed for sanitary sewer services. The tracer wire shall be a #12 solid copper with a HDPE or HMWPE jacket. Field splices shall be a heat shrunk waterproof mechanical crimp connection as manufactured by 3M or approved equal. The wire shall be taped to the sanitary sewer service at a minimum of ten foot intervals. The wire shall be brought to the ground surface at every clean-out, or if at a structure, it shall be cut 2-feet above the ground surface and attached to the side of the structure.

Q. **Trench Stabilization Material**: 1 to 3-inch clean, angular, well-graded crushed rock shall be used as directed by the Engineer to stabilize the bottom of the trench. The trench stabilization material shall not come in contact with the pipe and will not eliminate the need for sanitary sewer bedding material.

3. **CONSTRUCTION REQUIREMENTS**

A. **Excavation**: The trench shall be dug to the alignment and depth required and only so far in advance of
the pipe as the Engineer will permit. In general, the Contractor shall not leave more than 300-feet of
trench open at one time and all trenches shall be backfilled prior to the end of the day’s work.

Care shall be taken to maintain vertical trench walls in the pipe zone. The trench width shall not be less
than 12-inches or more than 24-inches greater than the outside diameter of the pipe. The trench walls
may be backsloped from a point level with the top of the pipe.

The trench shall be excavated as nearly as possible to the required grade so that the pipe may be laid on
undisturbed ground. Any part of the trench excavated below grade shall be backfilled with clean sand
thoroughly compacted into place. Where the bottom of the trench uncovered at subgrade is soft, and in
the opinion of the Engineer, cannot support the pipe, further depth and/or width shall be excavated and
refilled to the pipe subgrade with crushed rock thoroughly compacted into place which the Contractor
will be allowed extra compensation for. Other means of securing a firm foundation for the pipe may be
adopted if approved or ordered by the Engineer.

Ledge rock, boulders and large stones shall be removed to provide a clearance of at least 4-inches on all
sides of the pipe. Adequate clearance for properly jointing the pipe shall be provided at all bell holes.
Excavation below subgrade in rock or boulders shall be refilled to subgrade with clean sand, thoroughly
compacted. Construction equipment and methods shall insure systematic progress of the work without
causin danger to completed work or to adjacent public or private property.

B. Trench Bracing and Sheeting: Trenches shall be securely held by bracing and sheeting which may be
removed when the backfill level has reached the elevation necessary to protect the pipe work and
adjacent property. Trenches shall be so braced that personnel may work therein safely and efficiently.
In the event that sheeting is not considered necessary, the Contractor shall assume all liability for all
damages to property or injury to workmen or other persons, which may occur because of such omission.

C. Protection of Structures: The Contractor shall, at his own expense, shore up and otherwise protect any
building or other structure which may, in the opinion of the Engineer, be endangered during the work,
and the Contractor shall restore all structures, culverts, fences, walls or other properties disturbed
during the work to a condition similar or equal to that existing before their operation.

D. Water: The contractor shall keep the trenches free from water at all times as work progresses. Water
shall not be permitted to rise in un-backfilled trenches after the pipe has been laid.

E. Sewer and Water Installation Contractors: A sewer and water installation contractor as defined in the
South Dakota State Plumbing Code shall have a state license issued by the Board under the South
Dakota Sewer and Water Installers Rules and Regulations as set out in the State Plumbing Code before
work can be performed within the City of Vermillion and the State of South Dakota. The above license
shall not be required of persons licensed as Plumbing Contractors, Plumbers, or Plumber’s Apprentice
under State statute 36-25. The applicable City license shall also be provided by the Contractor.

F. Pipe Laying: The pipe shall be carefully laid to the line and grade shown on the drawings using a laser
beam to obtain a uniform grade and line. All pipes shall be laid with the bells upgrade. Any discrepancy
or irregularity of line and grade stakes shall be immediately called to the attention of the Engineer and
pipe laying shall be discontinued until the cause of the discrepancy is found and corrected and the
Engineer gives permission to continue.

As construction progresses, the pipe shall be cleaned of any foreign material enter the pipe. When the
work is stopped, the exposed end of the pipe shall be plugged to prevent the entrance of dirt, animals or
other foreign objects. The interior of all pipes shall be clean and free of foreign material at the time of
acceptance by the owner.
G. **Joints:** All pipes shall be laid with the bell end of the pipe upstream. Before joining the pipe in the trench, the bell and spigot surfaces shall be wiped free of dirt or other foreign matter. A lubricant or sealer as recommended by the pipe manufacturer shall be applied to the bell and spigot mating surfaces just before they are joined together.

All sewer repairs and new sewer connections must use a Strong Back Fernco, or approved equal, when connecting to an existing pipe. This applies to all connections within the City’s right-of-way.

H. **Manholes:** Manholes and drop manholes shall be constructed at points shown on the drawings or at points otherwise designated by the Engineer. The base of the manhole shall be cast in place or be precast concrete, 8-inches thick with a 48-inch inside diameter unless otherwise stated in the plans or special provisions. The floor is an essential part of the manhole. The floor shall be a smooth steel-troweled finish. Main channels shall be molded, or made up of a half section of tile. Lateral channels shall be molded and directional. Invert channels to be at least ½ diameter of a sewer. Floors and footings may be built in two stages with an 8-inch footing and 3-inch (minimum) finished floor. Mix for the finished floor shall be equal or better than the specified concrete mix. All joints in pre-cast concrete manholes shall be sealed with RAM-NEK or approved equal. Mortar and adjusting rings shall be used to set casting to grade.

I. **Backfill:** Backfill around the pipe and fittings shall be thoroughly tamped, by hand, to a level 12-inches above the pipe using selected materials. Stones larger than 2-inches in diameter shall not be placed within 2-feet of the top of the sanitary sewer pipe. Backfill shall not contain debris, frozen material, large clods or stones, organic matter or other unstable material. At street intersections and at other points where paving, walks, curb and gutter or other permanent improvements have been made or are proposed within the foreseeable future, as shown on the plans or in the specifications, backfill shall be placed in successive layers so as to provide a degree of compaction equal to 95% of the maximum density as determined by the Standard Proctor Method (AASHTO 799). The City will pay for the testing. All testing required due to failing results shall be paid for by the Contractor. In all other areas, the compaction above the level of 12-inches over the top of the pipe shall be at least equal to the surrounding soil.

All existing gravel surfaces shall be replaced to the same thickness as the existing surface or 6-inches of crushed aggregate base course, whichever is greater.

Unless otherwise specified in the specifications, any surplus material remaining shall become the property of the Contractor and it shall be his duty to dispose of it at his own expense.

J. **Protecting Underground and Surface Structures:** Temporary supports, adequate protection and maintenance of all underground and surface utility structures, drains, sewers, house and service connections for both sewer and water and other obstructions encountered in the progress of the work shall be furnished by the Contractor at his own expenses under the direction of the Engineer.

Whenever possible, all existing utility structures or branch connections leading therefrom will be located in advance of the excavation of the trench and properly marked. The Contractor shall not cut any existing utility lines unless it is determined by the Engineer that it must be done to install the new sewer pipes. All utility lines that are cut or broken by the Contractor without the approval of the Engineer shall be repaired or replaced by the Contractor at his own expense.

K. **Removal of Trees:** The Contractor shall include in his bid for furnishing and installing the sewer pipe the cost of removing and disposing, as directed by the Engineer, such trees that interfere with the sewer construction.

L. **Extras:** No extra allowance will be made for rock, water, quicksand, or other unexpected material
except as covered by other bid items; and Contractors in making their bids, do so with the full understanding that the work be completed for the price named in their bid except for extras ordered, in writing, by the Engineer.

M. **Pavement Cutting:** Where sanitary sewer is installed in streets on which asphalt or concrete pavement exists, the pavement shall be neatly cut out in a straight line along both edges of the trench. Cutting shall be done with a concrete saw. The paving so cut will be removed, loaded and hauled to a site designated by the Engineer. Cut width of paving will be approved by the Engineer.

N. **Pavement Restoration:** Pavement repair shall present a finished surface similar to the surrounding street surface. PCC pavement shall be repaired to the same thickness and reinforcement as was existing before the pavement was cut. Asphalt pavement shall be repaired to the same thickness as the existing pavement or 4-inches, whichever is greater, properly compacted with an adequate sized roller or vibratory packer. The surface of the finished repair shall conform to the grade of the existing pavement and a depression or a hump of more than ¼-inch will not be allowed.

O. **Test Requirements:**

P. **Laboratory or Plan Testing:** PVC pipe, ABS pipe and reinforced concrete pipe shall be tested at the factory. The manufacturer shall furnish a certificate and test reports for each carload, showing the conformity of his material with the specifications herein, and that each and every piece of pipe, and fittings, has been inspected for visible physical defects, and defective pieces rejected.

Q. **Deflection Test:** No deflection is allowed in the sewer main piping unless prior approval has been obtained from the Engineer.

Deflection tests shall be performed by the Contractor on all sewers. Deflection tests shall be conducted after the final backfill has been in place at least 30-days. Deflection tests shall be conducted no more than 45-days after the final backfill has been in place. Deflection tests shall be made using a deflection gauge (mandrel) device or other approved method. The diameter of the deflection gauge device shall be 95-percent of the undeflected inside diameter of the flexible pipe. The Contractor shall be required to install the pipe in such a manner so that the diametric deflection of the pipe shall not exceed 5-percent.

Any sewer main which the deflection gauge does not pass through the sewer main shall be corrected by the Contractor at no additional expense to the owner. The Contractor shall be responsible for all related costs for corrective methods, including all street, alley, boulevard or etc., restoration.

If defective workmanship, material or insufficient testing results are found in the sewer main or manholes, all shall be corrected by the Contractor at no additional expense to the owner. The Contractor shall be responsible for all related costs for corrective methods, including all street, alley, boulevard or etc., restoration.

R. **Infiltration Test:** Tests for water tightness shall be made by the Contractor in the presence of the Engineer, and the sewer and connections shall not leak under the exterior normal ground-water pressure in excess of a rate of 200 gallons per 24-hour day per mile of sewer per inch diameter. The tests and the measurements of infiltration shall be conducted in a manner approved by the Engineer.

When existing sanitary sewers which have service connections are being reconstructed or replaced (example: street reconstruction projects), the leakage test requirements may be waived or other testing methods substituted, subject to the approval of the Engineer.

S. **Manhole Tests:** Visual and either manhole vacuum test or manhole exfiltration test shall be performed
on each manhole. The preferred manhole leakage test method is the manhole vacuum test.

1) **Visual Test:** The Engineer shall visually inspect each manhole, both exterior and interior, for flaws, cracks, holes, or other inadequacies which might affect operation or watertight integrity of the manhole. Should any inadequacies be found, the Contractor, at his expense, shall make any repairs deemed necessary by the Engineer.

2) **Manhole Vacuum Test:** The test shall be performed in accordance with ASTM C1244. The following procedure is summarized from ASTM C1244 and shall be followed in conjunction with ASTM C1244 unless modified by the Engineer. The vacuum test shall include testing the top of the manhole, excluding the adjusting rings and manhole frame and cover. Testing will be allowed after backfill has occurred. Manhole vacuum tester assembly and vacuum pumps shall be as manufactured by Cherne Industries, Inc. or approved equal. Repairs of leaks may require the removal and replacement of manhole sections. The use of grout to repair leaks will not be allowed. The procedure requires all lift holes to be plugged. All pipes entering the manhole shall be temporarily plugged, taking care to securely brace the pipes and plugs to prevent them from being drawn into the manhole. The test head shall be placed at the top of the manhole in accordance with the manufacturer’s recommendations. A vacuum of 10 inches of mercury shall be drawn on the manhole, the valve on the vacuum line of the test head closed, and the vacuum pump shut off. The time shall be measured for the vacuum to drop to 9 inches of mercury. The manhole shall pass if the time for the vacuum reading to drop from 10 inches of mercury to 9 inches of mercury meets or exceeds the values indicated in Table (Manhole Vacuum Test). If the manhole fails the initial test, necessary repairs shall be made by an approved method. The manhole shall then be retested until a satisfactory test is obtained.

3) **Manhole Exfiltration Test:** The Contractor shall furnish all necessary equipment and materials and shall be responsible for conducting, in the present of the Engineer, an exfiltration test on each manhole. The manhole shall not allow exfiltration of water of more than 0.10 gallons per hour per foot diameter per foot head (0.10 gal/hr/ft dia/ft head) with head being measured from the top of the water surface in the test manhole to the groundwater level outside the manhole or to the bottom of the manhole, whichever is less.

All pipes leading into our out of the manhole shall be plugged to provide a watertight seal and the manhole filled with water to a level three to four inches below the casting rim. The water shall be
allowed to stand for two hours prior to beginning the test to allow for absorption into the manhole. If the water had dropped at the end of the two hour stabilization period, additional water shall be added to bring the water level to the original elevation.

The minimum test period shall be for two hours and the values derived from Table (Manhole Exfiltration Test) will need to be adjusted for the actual test time. If the test fails to meet these requirements, the Contractor shall, at his own expense, determine the source of the leakage, repair or replacement all deficiencies, and retests the installation until passing, all in a manner approved by the Engineer.

4. **METHOD OF MEASUREMENT**

A. **Connect to Exist. San Manhole** will be measured as a unit for each connection being performed.

B. **San Swr Bedding Material** will be measured in linear feet of compacted in place material.

C. **San Swr Stabilization Rock** will be measured in linear feet of crushed rock compacted in place to the nearest tenth. The rock shall be 1 ½ - inch maximum size crushed aggregate.

D. **San Swr, ≤8-ft** will be measured in feet, to the nearest tenth, by the Engineer. The length will be obtained by measuring from the center of structure to the center of structure. This is only for pipe buried 8-feet or less (invert to top of ground).

E. **San Swr, >8-ft** will be measured in feet, to the nearest tenth, by the Engineer. The length will be obtained by measuring from the center of structure to the center of structure. This is only for pipe buried more than 8-feet (invert to top of ground).

F. **San Manhole, ≤8-ft** will be measured per each. Item is for sanitary manholes 8-feet or less in depth measured from the bottom of the floor to the top of casting.

G. **San Manhole, >8-ft** will be measured per each. Item is for sanitary manholes greater than 8-feet in depth measured from the bottom of the floors to the top of the casting.
H. Adjust San Manhole will be measured as a unit for each manhole being adjusted.
I. Replace San Manhole Covers will be measured as a unit for each manhole being replaced.
J. Fitting will be measured as a unit for each fitting being installed.
K. San Swr Tap will be measured as a unit for each tap being performed.
L. Jacking/Boring/Tunneling will be measured in feet, to the nearest tenth, by the Engineer.
M. Pmmt Cutting and Patching will be measured in square yard of pavement cut, removed and patched. The length and width of pavement cuts and patches will be measured by the Engineer.

5. BASIS OF PAYMENT

A. Connect to Exist. San Manhole will be paid for at the unit price bid per each connection. Payment includes coring or cutting into the existing manhole, pipe connectors, grout and waterstop (when required).
B. San Swr Bedding Material will be paid for at the unit price bid per lineal foot of compacted in place material, inclusive of materials, labor, equipment, excavation and incidentals necessary.
C. San Swr Stabilization Rock will be paid for at contract unit price per linear feet of crushed rock compacted in place. Payment will be full compensation for furnishing and installing the crushed aggregate.
D. San Swr, ≤8-ft will be paid for at the contract unit price per foot for furnishing the pipe, special sections, gaskets, connecting devices and coupling bands and for installing the pipe, special sections, gaskets, connecting devices and coupling bands.
E. San Swr, >8-ft will be paid for at the contract unit price per foot for furnishing the pipe, special sections, gaskets, connecting devices and coupling bands and for installing the pipe, special sections, gaskets, connecting devices and coupling bands.
F. San Manhole, ≤8-ft will be paid for a the contract unit price per manhole for each design furnished and accepted, inclusive of materials, labor, equipment, excavation and incidentals necessary.
G. San Manhole, >8-ft will be paid for a the contract unit price per manhole for each design furnished and accepted, inclusive of materials, labor, equipment, excavation and incidentals necessary.
H. Adjust San Manhole will be paid for at the contract unit price per each adjustment performed. The installation of an internal inflow and infiltration barrier is included on all adjustments of 4-inches or more. Payment will be full compensation for furnishing materials, labor and equipment necessary.
I. Replace San Manhole Covers will be paid for at the contract unit price per each manhole cover replaced. Payment will be full compensation for furnishing materials, labor and equipment necessary.
J. Fitting will be paid for at the contract unit price per each fitting being installed. Payment will be full compensation for furnishing and installing any fitting required.
K. San Swr Tap will be paid for at the contract unit price per each tap being performed. Payment will be full compensation for furnishing pipe, fittings, concrete encasement, and bedding and backfill material, tap, testing and inspection.
L. Jacking/Boring/Tunneling will be paid for at the unit price bid per lineal foot of pipe jacked, bored or
tunneled in place, complete and ready for use.

M. Pavm Cutting and Patching will be paid for at the contract unit price per square yard of pavement cut, removed and patched complete in place and ready to use, inclusive of materials, labor, equipment, excavation and incidentals necessary.

END OF SANITARY SEWER SYSTEM
1. DESCRIPTION

This work consists of furnishing and installation of the various sizes, types and classes of pressure piping, fittings, and other appurtenances required to complete the work in accordance with the Drawings and as specified herein.

2. MATERIALS

A. **Class 150 C900 & C905 PVC Water Pipe:** PVC pressure pipe shall be Class 150 and shall meet the requirements of AWWA C900 (4”-12”) and AWWA C905 (14”-48”) with the exception that PVC Class Water Pipe shall be made to ductile iron O.D.’s instead of IPS. All Class 150 pipe shall meet the requirements of SDR 18. Pipe materials shall conform to ASTM D1784. The pipe shall bear the National Sanitation Seal for potable water pipe. Provisions must be made for expansion and contraction at each joint with a rubber ring. The bell shall consist of an integral wall section with a solid cross-section rubber ring which meets the requirements of ASTM D1869 for C900 and ASTM D1339 and ASTM F477 for C905. The bell section shall be designed to be at least as strong as the pipe wall. For water pipe to be installed by directional boring, Certa-Lok C900/RJ restrained joint PVC pressure pipe with Certa-Lok spline type coupling system, or approved equal, meeting the above requirements shall be provided.

Standard laying lengths shall be 20 ft. for all sizes. At least 85% of the total footage of pipe of any class and size shall be furnished in standard lengths, with the remaining 15% in random lengths. Pipe may be furnished with separate couplings in lieu of integral bell in order to achieve high deflection. Each length of pipe and bell shall be tested to four times the class pressure of the pipe for a minimum of five seconds.

B. **Class_150 C909 Ultra Blue PVCO Water Pipe:** PVCO pressure pipe shall be Class 150 and shall meet the requirements of AWWA C909 with the exception that PVCO Class Water Pipe shall be made to ductile iron O.D.’s instead of IPS. The pipe shall bear the National Sanitation Seal for potable water pipe. Ultra Blue PVCO pipe shall be manufactured from rigid PVC compound with a cell classification of 12454-B in conformance with ASTM D1784. PVCO pipe will be made from standard PVC plastic pipe starting stock having a Hydrostatic Design Basis (HDB) of 4000 psi. The finished PVCO pipe shall have an HDB of 7100 psi. Pipe joints shall be push-on joints conforming to the provisions of ASTM D3139, sealed by means of a rubber ring seated in an integral bell or a coupling. Couplings shall be a twin gasket coupling with a positive stop in the middle that will position the pipe ends within the coupling. Rubber rings shall conform to the requirements of ASTM F477. Ultra Blue PVCO pipe shall be as manufactured by Uponor ETI Co. or approved equal.

C. **Pipe Fittings:** Specials and fittings constructed of ductile iron, carbon steel for repair couplings, shall be provided for all polyvinyl chloride (PVC) and molecularly oriented polyvinyl chloride (PVCO) water line piping and at locations shown on the drawings. Mechanical joint ductile iron fittings shall conform to the requirements of AWWA C111 and AWWA C153, and repair couplings shall conform to the requirements of AWWA C219. Bolts for mechanical joint fittings shall be Cor-Blue, or approved equal. Bolts for repair couplings shall be stainless steel with coated nuts and anti-seize compound. The outside of all ductile iron fittings shall be coated with a bituminous coating. The inside of the ductile iron fittings shall be coated with a standard thickness cement mortar lining. Repair couplings shall be epoxy coated inside and out. All sleeves shall be solid sleeves with mechanical joints. Repair couplings shall be long body with stab type installation. Direct buried ductile iron specials and fittings, and repair couplings, shall be wrapped with polyethylene encasement conforming to the requirements of AWWA C105.
D. **Mainline Gate Valves:** Gate valves shall be designed for a bubble-tight, 200-psi water working pressure. The gate valves shall conform to AWWA Standard C 515 for "Resilient Seated Gate Valves." Gate valves shall be all bell with two inch (2") operating nut unless otherwise noted. Gate valves shall be iron body, fully bronze mounted, stationary stem, resilient wedge or disc seat with a clear water way equal to the full nominal diameter of the valve free of any sediment pockets, and shall be opened by turning counterclockwise. The ductile iron wedge or disc shall have sealing surfaces permanently bonded with resilient material to meet ASTM D429 "test for rubber to metal bond". The operating nut or wheel shall have an arrow, cast in the metal indicating the direction of the opening. Each valve shall have the makers monogram or initials, pressure rating and year of manufacture cast on the body. The gate valves shall be provided with "O" ring seal plates. Valves shall be furnished with joints compatible with the pipe to which they are connected.

The seal plate shall be fitted with at least two (2) "O" rings. The "O" rings shall be precision rubber products quality number 122-70 or equivalent. All exterior ductile iron surfaces of valves shall be thoroughly cleaned and coated with asphaltic varnish, applied hot. All interior surfaces shall be coated with a non-toxic epoxy safe for potable water. All bronze shall be left bright. Bonnet bolts shall be stainless steel.

Prior to shipment from the factory, each valve shall be tested by hydraulic pressure equal to twice the specified water working pressure. A written certification shall be furnished by the manufacturer that each valve has been satisfactorily tested and watertight.

The valves and boxes shall be wrapped with polyethylene encasement conforming to AWWA C105.

E. **Valve Boxes:** Valve boxes for gate valves shall be two piece cast iron, buffalo type (screw), with a 5-1/4 inch shaft diameter. Valve box castings shall be hot coated inside and outside with a rust resisting coating. The bottom part of the box shall have a bell conforming to the perimeter of the valve. The valve box covers shall be extra deep and fit the valve box snugly to prevent rattles or tipping due to traffic. Covers shall be provided with slots for easy and quick removal and supplied with the word "WATER" cast into the lid. Valve boxes shall be Tyler Model 666-S, or approved equal. The valve box shall be installed with a valve box adaptor. Valve box adaptors shall be the Valve Box Adaptor II by Adaptor Inc. or approved equal.

F. **Fire Hydrants:** Hydrants shall be non-jacket, traffic flange type, 5" valve operating against pressure. The hydrants shall be equipped with two 2 1/2" hose nozzles and one 4" steamer nozzle, a mechanical joint connection for 6" D.I. pipe and a barrel length for cover. The 2 1/2" nozzles shall have thread pattern 7530. The 4" nozzle shall have thread pattern 40502. The nozzles shall have nut caps with No. 6 square nuts and shall be provided with chains attached to nozzles. The nozzles shall be mechanically attached. The hydrant shall open right and have No. 6 square operating nuts. Hydrants shall be Waterous WB67 manufactured according to City of Vermillion requirements or equal, and approved by the Water Superintendent. The buried portion of the hydrant shall be wrapped with polyethylene encasement in accordance with AWWA C105. The fire hydrants are furnished by the City at no cost to the Contractor. The fire hydrants are located at 1530 S. Dakota. The Contractor shall be responsible for loading, transporting, and installation.

G. **Sleeves:** Sleeves shall be of gasketed, solid sleeve type, with diameter to properly fit the new water main pipe to the existing water main as shown on the drawings. All sleeves shall be ductile iron meeting the requirements of pipe fittings as specified in Section 3.02a of these Specifications. The sleeve shall be wrapped on the exterior with polyethylene wrapping in accordance with AWWA C105.
H. Repair Coupling/Reducers: Repair coupling/reducers shall be a two-layered EPDM gasketed, long body, stab type coupling/reducers, capable of joining water main pipes with diameter differences up to 1.3 inches. The repair coupling/reducers shall be Hymax 2000 series, or approved equal. All repair couplings/reducers shall be carbon steel meeting the requirements of pipe fittings as specified in Section 3.02a of these Specifications. The repair coupling/reducers shall be wrapped on the exterior with polyethylene wrapping in accordance with AWWA C105.

I. Mechanical Joint Restraints: Mechanical joint restraints shall be incorporated in the design of the follower gland. The restraint mechanism shall consist of a plurality of individually actuated gripping surfaces to maximize restraint capability. Glands shall be manufactured of ductile iron conforming to ASTM A536-80. The gland shall be such that it can replace the standardized mechanical joint gland and can be used with the standardized mechanical joint bell conforming to AWWA C111 and AWWA C153. Twist-off nuts, sized the same as tee head bolts, shall be used to insure proper actuating of restraining devices. Bolts shall be Cor-Blue. The restraining glands shall have a pressure rating equal to that of the pipe on which it is used and shall be EBAA Iron, Inc., or approved equal.

J. Pipe Tracer Wire: Pipe tracer wire shall be provided and installed for underground water main location. The tracer wire shall be a #12 solid copper with a HDPE or HMWPE jacket. Field splices shall be a heat shrunk water proof mechanical crimp connection as manufactured by 3M or approved equal. The wire shall be taped to the water main at a maximum of ten foot intervals. The wire shall be brought to the ground surface at every valve box and fire hydrant.

K. Select Fill Material: Select fill material shall be used for backfill where native material is unsuitable for use. The granular fill material shall be used as directed by the Engineer.

L. Water Main Bedding Material: Water main bedding material shall meet the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition section 820, size no. 1 gradation. Water main bedding material shall be used at locations where proposed water main is placed under street pavement and as directed by the Engineer for proper bedding of the pipe in wet and unstable areas.

M. Trench Stabilization Material: 1” to 3” clean, angular, well-graded crushed rock shall be used as directed by the Engineer to stabilize the bottom of the trench. The trench stabilization material shall not come in contact with the pipe and will not eliminate the need for water main bedding material.

N. Polyethylene sheet film: Polyethylene sheet film of 8 mil nominal thickness shall be provided and used for encasement of all fire hydrants, valves, tees, crosses, and any other ductile iron mechanical joint fittings and specials conforming to AWWA C105.

O. Water Service Lines: Water service lines 2 inches in diameter and smaller, from the City water main to the curb stop, shall be U.S. Government Type K soft copper tubing. Water service lines 2 inches in diameter and smaller, from the curb stop to the structure, shall be U.S. Government Type K soft copper tubing or polyethylene pressure pipe. Fittings and valves shall meet the requirements of AWWA C800 and ASTM B62 for Type K soft copper. Polyethylene service tubing may be used for services 2 inches and smaller and shall meet the requirements of AWWA C901-95 for pipe and fittings. Polyethylene service tubing shall be 200 PSI, SDR-7 (IPS), per AWWA C901. Copper and polyethylene service tubing shall have clearly identifiable labels communicating the type of material. All connecting fittings shall be lead-free brass, packed joint style, compression fittings. Stainless steel inserts shall be used at compression joint locations. Water service installations shall be inspected and approved by City Water Department personnel prior to backfilling.
3. CONSTRUCTION REQUIREMENTS

A. Excavation: The trench shall be dug to the alignment and depth required and only so far in advance of the pipe as the Engineer will permit. In general, the Contractor shall not leave more than 300-feet of trench open at one time and all trenches shall be backfilled prior to the end of the day’s work.

Care shall be taken to maintain vertical trench walls in the pipe zone. The trench width shall not be less than 12-inches or more than 24-inches greater than the outside diameter of the pipe. The trench walls may be backsloped from a point level with the top of the pipe.

The trench shall be excavated as nearly as possible to the required grade so that the pipe may be laid on undisturbed ground. Any part of the trench excavated below grade shall be backfilled with clean sand thoroughly compacted into place. Where the bottom of the trench uncovered at subgrade is soft, and in the opinion of the Engineer, cannot support the pipe, further depth and/or width shall be excavated and refilled to the pipe subgrade with crushed rock thoroughly compacted into place which the Contractor will be allowed extra compensation for. Other means of securing a firm foundation for the pipe may be adopted if approved or ordered by the Engineer.

Ledge rock, boulders and large stones shall be removed to provide a clearance of at least 4-inches on all sides of the pipe. Adequate clearance for properly jointing the pipe shall be provided at all bell holes. Excavation below subgrade in rock or boulders shall be refilled to subgrade with clean sand, thoroughly compacted. Construction equipment and methods shall insure systematic progress of the work without causing danger to completed work or to adjacent public or private property.

B. Trench Bracing and Sheeting: Trenches shall be securely held by bracing and sheeting which may be removed when the backfill level has reached the elevation necessary to protect the pipe work and adjacent property. Trenches shall be so braced that personnel may work therein safely and efficiently. In the event that sheeting is not considered necessary, the Contractor shall assume all liability for all damages to property or injury to workmen or other persons, which may occur because of such omission.

C. Protection of Structures: The Contractor shall, at his own expense, shore up and otherwise protect any building or other structure which may, in the opinion of the Engineer, be endangered during the work, and the Contractor shall restore all structures, culverts, fences, walls or other properties disturbed during the work to a condition similar or equal to that existing before their operation.

D. Water: The contractor shall keep the trenches free from water at all times as work progresses. Water shall not be permitted to rise in un-backfilled trenches after the pipe has been laid.

E. Sewer and Water Installation Contractors: A sewer and water installation contractor as defined in the South Dakota State Plumbing Code shall have a state license issued by the Board under the South Dakota Sewer and Water Installers Rules and Regulations as set out in the State Plumbing Code before work can be performed within the City of Vermillion and the State of South Dakota. The above license shall not be required of persons licensed as Plumbing Contractors, Plumbers, or Plumber’s Apprentice under State statute 36-25. The applicable City license shall also be provided by the Contractor.

F. Pipe Laying: The installation of PVC or PVCO water pipe shall conform to AWWA C605 standards. All pipe and accessories shall be new. Pipe and accessories shall be handled in such a manner as to insure delivery to the trench in sound, undamaged condition. Particular care shall be taken not to injure the pipe coatings. No other pipe or material of any kind shall be placed inside a pipe or fitting. The interior of the pipe shall be thoroughly cleaned of foreign matter before being lowered into the trench, and shall be kept clean during laying operations by plugging or other approved method. The full length of each section of pipe shall rest solidly upon the pipe bed with the recesses to accommodate bells and joints,
shaped by hand. Each pipe shall be laid true to line and grade and in such a manner as to form a close concentric joint with the adjoining pipe. Pipe shall not be laid in water or when trench or weather conditions are unsuitable for work. Water shall be kept from the trench until the joints have been completed in a satisfactory manner.

When work is not in progress, open ends of pipe and fittings shall be securely closed to prevent the entrance of trench water or other extraneous substances. Any section of pipe found to be defective before or after laying shall be replaced with sound pipe without additional expense to the City.

Where water lines cross under gravity sewer lines, the water pipe shall be fully encased for a distance of ten feet (10’) each side of the sewer line. The encasement shall consist of PVC encasement pipe closed at the ends with flexible reducing couplings. If no joint occurs in the sewer pipe for ten feet each side of the water line, encasement will not be required. The Contractor shall encase piping at other locations as shown on the Drawings or as may be directed by the Engineer.

G. Replacing Existing mains: Where new water main is to be installed alongside the existing main, the existing main must remain in service until the new water main has met all testing requirements. Existing water services shall be reconnected to the new water main before the existing main is taken out of service. In instances where the existing main is unable to be kept in service during construction of the new water main, temporary services shall be provided with prior approval by the Engineer. In instances where the existing main must be removed, the cost for removing existing pipe shall be included in the price bid for new water main pipe.

H. Cross Connections: Wherever feeder mains intersect existing mains, a cross connection shall be made with appropriate fittings as required, the City to do all necessary closing of the valves. The cost of each such cross-connection shall be included in the price bid for the new fittings installed.

I. Joint Restraints and Blocking: Joint restraints shall be installed on the pressure pipe fittings, valves, and fire hydrants at the locations shown on the Drawings and described in the Bid Proposal to conform to AWWA C600 standards and manufacturer’s recommendations. Tees, fire hydrants, and plugs shall also be blocked with solid precast concrete blocks with soil bearing surface equal to or exceeding that shown for poured blocks. Poured concrete may be required by Engineer if in their judgment field conditions are unsuitable for precast blocks.

J. Sleeves and Fittings: Sleeves and fittings shall be handled and installed in accordance with AWWA C600 standards and manufacturer's recommendations.

K. Cutting Pipe: Cutting of pipe shall be done in a neat and workmanlike manner without damage to the pipe. Cutting shall be done by means of an approved type of mechanical cutter.

L. Jointing: The type of joint used shall conform to the requirement for the applicable type of pipe. Jointing operations shall be carried out in strict adherence to the manufacturer’s recommendations. When joining PVC pipe to cast or ductile iron fittings, the bevel on the PVC shall be made the same as the bevel required for the fitting (normally shorter and steeper than factory pipe bevel). When joining to mechanical joint fittings, there shall be no pipe bevel.

M. Polyethylene sheet film: All ductile iron fire hydrants, valves, tees, crosses, and any other mechanical joint fittings and specials shall be wrapped with polyethylene encasement conforming to AWWA C105. The fitting shall be wrapped with a flat film sheet or split length of tubing by passing the sheet under the fitting and bringing it up around body. Seams shall be made by bringing the edges together, folding over twice, and taping down. The sheet film shall extend two feet beyond the joint area and be secured in place with plastic adhesive tape wrapped circumferentially around the pipe not less than three turns. Any rips, punctures or other damage shall be repaired with overlapping patches and adhesive tape.
N. **Setting Valves, Valve Boxes, and Fire Hydrants:** Valves, valve boxes, and fire hydrants shall be installed where shown on the Drawings and as directed by the Engineer in accordance with AWWA Standard C600 except as further specified herein. Valve boxes shall be centered on the valves. Earth fill shall be carefully tamped around each valve box to a distance of four feet (4') on all sides of the box or to the undisturbed trench face if less than four feet. Fire hydrants shall be set at such elevations that the connecting pipe will not have less cover than the distributing mains. The hydrant or valve shall be set upon a minimum solid precast concrete block 4 in. thick x 7-1/2 in. x 15 in. Mechanical joint restraints shall be installed on all valves and hydrants. The back of the hydrant, opposite the pipe connection, shall be firmly wedged and blocked against the vertical face of the trench to prevent the hydrant from blowing off the line. Not less than 10 cubic feet of crushed quartzite shall be placed around the base of the hydrant to insure drainage. The backfill around hydrants shall be thoroughly compacted to the grade line in a manner satisfactory to the Engineer. Hydrants and valves shall have the interiors cleaned of all foreign matter before installation. Stuffing boxes shall be tightened and the hydrant or valve shall be inspected in opened and closed positions to insure that all parts are in working condition. All underground ductile iron valves, fittings, and fire hydrant bodies shall be installed with polyethylene wrapping protection installed in accordance with AWWA Standard C105.

O. **Backfill:** Backfill around the pipe and fittings shall be thoroughly tamped, by hand, to a level 12-inches above the pipe using selected materials. Stones larger than 2-inches in diameter shall not be placed within 2-feet of the top of the sanitary sewer pipe. Backfill shall not contain debris, frozen material, large clods or stones, organic matter or other unstable material. At street intersections and at other points where paving, walks, curb and gutter or other permanent improvements have been made or are proposed within the foreseeable future, as shown on the plans or in the specifications, backfill shall be placed in successive layers so as to provide a degree of compaction equal to 95% of the maximum density as determined by the Standard Proctor Method (AASHTO 799). The City will pay for the testing. All testing required due to failing results shall be paid for by the Contractor. In all other areas, the compaction above the level of 12-inches over the top of the pipe shall be at least equal to the surrounding soil.

All existing gravel surfaces shall be replaced to the same thickness as the existing surface or 6-inches of crushed aggregate base course, whichever is greater.

Unless otherwise specified in the specifications, any surplus material remaining shall become the property of the Contractor and it shall be his duty to dispose of it at his own expense.

P. **Protecting Underground and Surface Structures:** Temporary supports, adequate protection and maintenance of all underground and surface utility structures, drains, sewers, house and service connections for both sewer and water and other obstructions encountered in the progress of the work shall be furnished by the Contractor at his own expenses under the direction of the Engineer.

Whenever possible, all existing utility structures or branch connections leading therefrom will be located in advance of the excavation of the trench and properly marked. The Contractor shall not cut any existing utility lines unless it is determined by the Engineer that it must be done to install the new sewer pipes. All utility lines that are cut or broken by the Contractor without the approval of the Engineer shall be repaired or replaced by the Contractor at his own expense.

Q. **Removal of Trees:** The Contractor shall include in his bid for furnishing and installing the sewer pipe the cost of removing and disposing, as directed by the Engineer, such trees that interfere with the sewer construction.

R. **Extras:** No extra allowance will be made for rock, water, quicksand, or other unexpected material
except as covered by other bid items; and Contractors in making their bids, do so with the full understanding that the work be completed for the price named in their bid except for extras ordered, in writing, by the Engineer.

S. **Pavement Cutting:** Where storm sewer is installed in streets on which asphalt or concrete pavement exists, the pavement shall be neatly cut out in a straight line along both edges of the trench. Cutting shall be done with a concrete saw. The paving so cut will be removed, loaded and hauled to a site designated by the Engineer. Cut width of paving will be approved by the Engineer.

T. **Pavement Restoration:** Pavement repair shall present a finished surface similar to the surrounding street surface. PCC pavement shall be repaired to the same thickness and reinforcement as was existing before the pavement was cut. Asphalt pavement shall be repaired to the same thickness as the existing pavement or 4-inches, whichever is greater, properly compacted with an adequate sized roller or vibratory packer. The surface of the finished repair shall conform to the grade of the existing pavement and a depression or a hump of more than ¼-inch will not be allowed.

U. **Test Requirements**

1) **Water Main Hydrostatic Pressure Testing:** Hydrostatic pressure testing shall be done in accordance with AWWA Standard C605. Upon completion of the installation of the water main all piping shall be hydrostatically tested, by the contractor, by pumping water into the water main up to a pressure of 120 psi. The 120 psi pressure must be maintained for a period of two (2) hours minimum. The Engineer must be present to observe the hydrostatic pressure test of the water main before the water main will be accepted by the City. If the Contractor is unable to maintain a pressure of 120 psi +/- 5 psi for two hours, the Contractor shall then measure the leakage rate by pumping water into the water main at 120 psi.

The allowable leakage under this test shall not exceed the value determined by the following formula:

\[ L = \frac{ND(10.95)}{7400} \]

- \( L \) = Allowable leakage, gallons per hour
- \( N \) = Number of joints in length of pipeline
- \( D \) = Nominal diameter of pipe, inches
- \( P \) = Test Pressure, PSI Gauge (the square root of 120 psi = 10.95)

If any section of the water main does not meet the pressure test or leakage test requirements, the Contractor at his own expense shall locate and repair any defects and retest the water main until it meets the requirements of the specified test.

The Contractor shall furnish all pumping equipment, labor, and gauges required for this hydrostatic pressure test and any added costs for this test shall be included in the unit price bid for water main pipe.

V. **Clean Up:** Upon completion of the work, the Contractor shall remove all surplus construction materials and debris resulting from the work and all areas of work shall be left in an orderly manner.

W. **Disinfection:** Water main shall be disinfected in accordance with AWWA C651 or as directed by the Engineer. All water mains installed shall be chlorinated by the Contractor using the “tablet method”. The tablet method consists of placing calcium hypochlorite tablets in the water main as it is being installed and then filling the main with potable water when installation is completed. This method may be used
only if pipes and appurtenances are kept clean and dry during construction.

During construction, 5-g calcium hypochlorite tablets shall be placed in each section of pipe. Also, one tablet shall be placed in each hydrant, hydrant branch, and other appurtenance. The number of 5-g tablets required for each pipe section shall be 
\[ (0.0012)(d^2)(L) \]
rounded to the next higher integer, where \( d \) is the inside pipe diameter, in inches, and \( L \) is the length of the pipe section, in feet. The tablets shall be attached by a food-grade adhesive. There shall be adhesive only on the broadside of the tablet attached to the surface of the pipe. Attach all the tablets inside and at the top of the main, with approximately equal numbers of tablets at each end of a given pipe length. If the tablets are attached before the pipe section is placed in the trench, their position shall be marked on the section to indicate that the pipe has been installed with the tablets at the top. Once water main construction, or portion thereof is complete, the Contractor shall request to have the pipe segment filled by City personnel. Once the pipe segment has been filled, the Contractor can begin the hydrostatic pressure testing requirements (Section 3.06).

The chlorinated water shall remain in the water main for a minimum of 24 hours. Upon completion of the minimum contact time, the Contractor shall request to have the water main flushed by City personnel. In order to prevent corrosion damage to the pipe lining, heavily chlorinated water shall not remain in contact with the water main for more than 72 hours. The water main shall be adequately flushed to remove all heavily chlorinated water and remaining particulates. The Contractor shall be responsible for the dechlorination and/or disposal of heavily chlorinated water.

Once flushing is complete and before the new water main is connected to the distribution system, two consecutive sets of acceptable samples, taken at least 24 hours apart, shall be collected by the Contractor from the new main for coliform bacteria testing; and, if required, the presence of a chlorine residual. At least one set of samples shall be collected from every 1,200 feet of the new water main.

Samples shall be collected in sterile bottles treated with sodium thiosulfate. No hose or fire hydrant shall be used in the collection of samples (for pipe repairs, if no other sampling port is available, well-flushed fire hydrants may be used with the understanding that they do not represent optimum sampling conditions). There should be no water in the trench up to the connection for sampling. A corporation cock may be installed in the main with a copper-tube gooseneck assembly. After samples have been collected, the gooseneck assembly may be removed and retained for future use.

If the initial disinfection produces a set of passing coliform bacteria tests (coliform bacteria absent), the water main can be put into service and service lines tapped. If the initial disinfection fails to produce a set of passing coliform bacteria tests, the Contractor must request that the water main be refilled and resampled. If the second set of coliform bacteria tests fails, the Contractor shall rechlorinate the water main by the continuous feed or slug method (liquid chlorine injection through a service tap) until the coliform bacteria test passes. Cost for disinfecting the water main shall be included in the unit price bid for water main pipe.

4. METHOD OF MEASUREMENT

A. Water Main Bedding Material will be measured in linear feet of compacted in place material.

B. Water Main Stabilization Rock will be measured in linear feet of crushed rock compacted in place to the nearest tenth. The rock shall be 1 ½ - inch maximum size crushed aggregate.

C. Insulation will be measured in linear feet, to the nearest tenth, by the Engineer. The length will be obtained by measuring the pipe being insulated.

D. Water Main, s8-ft will be measured in feet, to the nearest tenth, by the Engineer. The length will be
obtained by measuring from the center of fitting, or valve, to the center of fitting, or valve. This is only for pipe buried 8-feet of less (invert to top of ground).

E. **Water Main, >8-ft** will be measured in feet, to the nearest tenth, by the Engineer. The length will be obtained by measuring from the center of fitting, or valve, to the center of fitting, or valve. This is only for pipe buried more than 8-feet (invert to top of ground).

F. **Valve** will be measured as a unit for each valve being installed.

G. **Fitting** will be measured as a unit for each fitting being installed.

H. **Adjust Water Box** will be measured as a unit for each water box being adjusted.

I. **Water Main Restraint** will be measured as a unit for each restraint being installed.

J. **Jacking/Boring/Tunneling** will be measured in feet, to the nearest tenth, by the Engineer.

K. **Fire Hydrant** will be measured as a unit for each fire hydrant furnished and installed.

L. **Adjust Fire Hydrant** will be measured as a unit for each hydrant being adjusted.

5. **BASIS OF PAYMENT**

A. **Water Main Bedding Material** will be paid for at the unit price bid per linear foot of compacted in place material, inclusive of materials, labor, equipment, excavation and incidentals necessary.

B. **Water Main Stabilization Rock** will be paid for at contract unit price per linear feet of crushed rock compacted in place. Payment will be full compensation for furnishing and installing the crushed aggregate.

C. **Insulation** will be paid for at the contract unit price per linear feet of insulation installed. Payment will be full compensation for furnishing and installing the insulation.

D. **Water Main, ≤8-ft** will be paid for at the contract unit price per foot for furnishing and installing the pipe. Payment will be full compensation for excavation, dewatering, tracer wire, testing, disinfection, and polyethylene wrap for ductile iron pipe and for fittings.

E. **Water Main, >8-ft** will be paid for at the contract unit price per foot for furnishing and installing the pipe. Payment will be full compensation for excavation, dewatering, tracer wire, testing, disinfection, and polyethylene wrap for ductile iron pipe and for fittings.

F. **Valve** will be paid for at the contract unit price per each valve being installed. Payment will be full compensation for furnishing and installing any valves required along with valve box and cover, valve box extension, and valve stem extension.

G. **Fitting** will be paid for at the contract unit price per each fitting being installed. Payment will be full compensation for furnishing and installing any fitting required.

H. **Adjust Water Box** will be paid for at the contract unit price per each adjustment performed. Payment will be full compensation for furnishing all labor, material and equipment for the adjustment.

I. **Water Main Restraint** will be paid for at the contract unit price per each restraint being installed. Payment will be full compensation for furnishing all labor, material and equipment necessary for the installation of the water main restraint.

J. **Jacking/Boring/Tunneling** will be paid for at the unit price bid per linear foot of pipe jacked, bored or
tunneled in place, complete and ready for use.

K. **Fire Hydrant** will be paid for at the contract unit price per each fire hydrant that is furnished and installed. Payment will be full compensation all labor, material and equipment necessary for the installation of the fire hydrant.

L. **Adjust Fire Hydrant** will be paid for at the contract unit price per each adjustment performed. Payment will be full compensation for furnishing all labor, material and equipment for the adjustment.

END OF WATER SYSTEM
9000 – ROOF ASSEMBLIES (ASPHALT)

1. DESCRIPTION

The work consists of removing the existing roofing materials and replacing with new underlayment, asphalt shingles, flashing, vents, etc.

2. MATERIALS

A. Asphalt Shingles: Asphalt shingles shall comply with ASTM D 225 or D 3462. Shingles shall be a Class H wind resistant shingle, per ASTM D 7158. Ridgecap shall be of the same manufacturer product line. Color will be determined upon consultation with City staff.

B. Fasteners: Fasteners for asphalt shingles shall be galvanized steel, stainless steel, aluminum, or copper roofing nails, minimum 12 gage shank with a minimum 3/8” diameter head, of a length to penetrate through the roofing materials and a minimum of 3/4” into the roof sheathing. Fasteners shall comply with ASTM F 1667.

C. Underlayment: Shall conform to ASTM 226; must be at least 36 inches wide and 30 lb felt or synthetic equivalent.

D. Ice barrier: The material shall comply with ASTM D 1970.

E. Valleys: The valley lining shall be a minimum of 1 ply smooth roll roofing, complying with ASTM D 6380, and at least 36 inches wide.

F. Vents: All roof vents shall be replaced with an equivalent style vent.

G. Flashing: The flashing shall be a minimum of 24 gauge (0.024 inch mil) finish sheet aluminum.

H. Sheathing: Minimum 1/2” CDX 3-ply plywood.

I. Gutter Apron: Minimum 24 gauge; color will be determined upon consultation with City Staff.

3. CONSTRUCTION REQUIREMENTS

Asphalt shingles shall have the minimum number of fasteners as required by the manufacturer.

Ice barrier shall be used in lieu of normal underlayment, and extend from the lowest edges of all roof surfaces to a point at least 24 inches inside the exterior wall line of the building.

Minimum of one 36 inch-wide strip of ice barrier shall also be used in all valleys.

Valleys shall be closed-cut. Valley linings shall be installed in accordance with the manufacturer's installation instructions before applying shingles.

All flashing and vents shall be replaced and installed in accordance with the asphalt shingle manufacturer's installation instructions.
4. **METHOD OF MEASUREMENT**

A. **Roof Assemblies, Asphalt** will be measured per roofing square. A roofing square is equivalent to a 10 foot by 10 foot section of roof, or 100 square feet. Plans quantity will be used. If changes from the plan quantity are ordered these areas will be measure and the plan quantity appropriately adjusted.

B. **Sheathing** will be measured per square foot. Plans quantity will be used. If changes from the plan quantity are ordered these areas will be measure and the plan quantity appropriately adjusted.

5. **BASIS OF PAYMENT**

A. **Roof Assemblies, Asphalt** will be paid at the contract unit price per roofing square. This price shall include removal, disposal, and installation of underlayment, shingles, ice barrier, fasteners, flashing, vents, and other materials necessary to complete the work as required per the plans and specifications.

B. **Sheathing** will be paid at the contract unit price per square foot. This price shall include removal, disposal, and installation of plywood sheathing and any other materials necessary for the replacement of the sheathing.

**END OF ROOF ASSEMBLIES (ASPHALT)**
1. DESCRIPTION

The work consists of removing the existing roofing materials and replacing with new EPDM membrane, flashing, wood blocking, vent pipe flashing, prefinished coping, counterflashing and insulation. Ballast shall be reused.

2. MATERIALS

A. **EPDM Membrane**: Membrane shall comply with ASTM D4637. It must be a minimum of 60-mils thickness. The color shall be the manufacturer's darkest color, preferably black.

B. **Insulation Board**: Boards shall be either polysocyanurate or molded polystyrene. The proposed insulation shall match the thickness and ‘R’ value of the existing insulation. The insulation shall also be compatible with the membrane and substrate.

C. **Flashing**: The flashing shall be either zinc-coated steel, stainless steel, aluminum or prepainted sheet metal, 24-gauge minimum. The City will select a standard color from a palette supplied by the contractor.

D. **Fasteners**: The fasteners shall be non-corrosive and concealed.

E. **Wood**: The wood shall be either exterior grade or pressure treated.

3. CONSTRUCTION REQUIREMENTS

A. The work includes the following:

1) Removing the existing ballast and saving for later use.

2) Removing the existing EPDM membrane and associated flashings.

3) Kick all the insulation tight and fill all the voids.

4) Install new wood blocking to accommodate height of new insulation.

5) Installing an EPDM rubber roof membrane and the existing rock ballast.

6) Installing vent pipe flashings and all other associated flashings as required.

7) Installing prefinished coping and counterflashing at perimeter walls.

8) Replace any wet or deteriorated insulation.

B. All of the materials used shall be compatible with the EPDM membrane system and approved by the manufacturer.

C. The contractor must furnish a twenty-year minimum manufacturer’s total system warranty in addition to the one-year contractor’s guarantee. The warranty period will start when the final payment is made.
4. METHOD OF MEASUREMENT

   A. Roof Assemblies, EPDM Membrane will be measured per lump sum.

   B. Roof Insulation Board Replacement will be measured per board foot. Plans quantity will be used. If changes from the plan quantity are ordered these areas will be measured and the plan quantity appropriately adjusted.

5. BASIS OF PAYMENT

   A. Roof Assemblies, EPDM Membrane will be paid at the contract unit price per lump sum. This price shall include salvaging existing ballast for later use, removal and disposal of existing EPDM membrane and flashing, installation of new wood blocking, new EPDM membrane roof, flashing, coping, counterflashing, and placement of salvaged ballast, and other materials necessary to complete the work as required per the plans and specifications.

   B. Roof Insulation Board Replacement will be paid at the contract unit price per board foot. This price shall include removal, disposal, and installation of roof insulation and any other materials necessary for the replacement of the roof insulation.

END OF ROOF ASSEMBLIES (EPDM MEMBRANE)
10000 - LANDSCAPING

1. DESCRIPTION

This work consists of preparing a seedbed, furnishing and planting seed, furnishing and applying fertilizer on seeded areas, and placing a mulch cover on slopes or other designated areas following seeding and fertilizing operation, except roadbeds, within the limits of the work.

2. MATERIALS

A. Seeding

1) General: The seed shall comply with the requirements of the South Dakota Seed Law.

2) Origin Limitations: Seed furnished shall have been grown in South Dakota, North Dakota, Montana, Wyoming, Nebraska, Iowa, or Minnesota.

3) Labeling: Each bag of seed delivered to the project shall bear a tag which shows the following information:

   a) Name and address of supplier.
   b) Project number for which seed is to be used.
   c) Suppliers lot number for each kind of seed in the mixture.
   d) Origin (where grown) for each kind of seed.
   e) Purity, germination, and other information required by South Dakota Seed Law, for each kind of seed.
   f) Pounds of bulk seed of each kind of seed in each bag.
   g) Total pounds of bulk seed mixture in each bag.
   h) Pounds of pure live seed (PLS) of each kind of seed in each bag.
   i) Total pounds of PLS mixture in each bag.
   j) Dormant seed and hard seed.

4) Seed Mix:

   a) 90 pounds per acre of bluegrass.
   b) 20 pounds per acre of ryegrass.
   c) 10 pounds per acre of fescue.

B. Fertilizing

1) Fertilizer shall be a dry, standard commercial project conforming to the South Dakota Fertilizer Law and subsequent amendments or revisions. Each brand and grade of fertilizer must be registered with the State Department of Agriculture. Each bag or other container shall clearly show the net weight of the contents, the name and address of the manufacturer, the brand and grade, and the
guaranteed analysis of the contents, and showing the minimum percentages of total nitrogen available, phosphoric acid, and water soluble potash, in that order. Fertilizer shall be in a condition, which will permit proper distribution.

2) Testing of fertilizer will not be required. Before any fertilizer is approved for use, the Contractor shall submit to the Engineer a certified statement from the manufacturer stating that the fertilizer is registered for sale in South Dakota and complies with the South Dakota Fertilizer Law. The certified statement shall include the Contractor’s name, the project number, and all information that appears on the containers, as listed above.

3) Fertilizer for small projects, under two acres of seeding area, shall be 18-46-0 which shall be applied at a rate of 200# per acres, unless specified otherwise by the Engineer. Fertilizer type and quantity for projects with seeding area larger than two acres shall be based upon testing of topsoil for horticultural properties. Test results and fertilizer type shall be submitted to the Engineer for approval.

C. Mulching:

1) **Gray Hay or Straw Mulch**: Grass hay or straw mulching shall be substantially free of noxious weed seeds and objectionable foreign matter. The mulch shall have been baled dry, in bales of approximately equal weight and shall be relatively dry when applied. The Engineer will reject materials having characteristics, making them unsuitable for the purpose intended.

2) **Fiber Mulch**: Fiber Mulching shall contain no germination or growth inhibiting factors and shall have the property of becoming evenly dispersed and suspended when agitated in water. When sprayed uniformly on the surface of the soil, the fibers shall form a blotter-like ground cover, which will readily absorb water and allow infiltration to the underlying soil without restricting emergence of seedlings. Weight specification from suppliers, and for all applications, shall refer only to air dry weight of the fiber, considered to be 10 (10%) percent moisture.

3) **Compost or Wood Chip Mulch**: Compost shall be ¾ inch minus and 3/8 inch minus screened material. Wood Chip Mulch shall be material passing the ¾ inch screen. No chemical additives shall be added during the composting process. The process shall be completely natural utilizing the organic feedstock, water, and air. The material shall be composted to a ratio of 30 parts carbon to 1 part nitrogen before screening the material. The compost shall be registered through the South Dakota Department of Agriculture as a soil amendment.

4) **Hydroseeding Tackifier Amendment**: Hydroseeding tackifier amendment shall be a safe, non-toxic polymer that can be used with any paper or fiber mulch products. The anionic high molecular weight polymer binds the hydroseeding media to the soil particles. The tackifier shall be hydrophobic and allow water into the mulch matrix. The tackifier shall be a synthetic material that is free of weed seed and any organic containments. It shall be compatible with biostimulants, fertilizers and surfactants. It shall not clump in the tank and clog the spray nozzle. The tackifier lubricates the slurry mix and tightens the slurry stream and will increase the shooting distance. The tackifier will break down from UV light in 5 – 6 weeks.

The tackifier can be used as temporary dust abatement in non-traffic areas. The tackifier can be applied as a temporary soil stabilizer to protect against erosion. The tackifier can be applied through hydraulic equipment for clarifying sediment/holding ponds.

3. CONSTRUCTION REQUIREMENTS

A. Seeding
1) The topsoil to be used in the areas to be seeded or hydroseeded shall have a minimum depth of 6-inches.

   a) The Contractor shall calibrate the drill or hydro seeder on each project. Calibration runs may be performed on areas to be seeded.

2) **Seasonal Limitations:** Shall be the same as those in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2004 Edition section 730.

3) **Equipment and Methods**

   a) **Seedbed Preparation:** Initial preparation of newly graded areas for seeding shall be worked to a minimum depth of 6-inches. Every effort shall be made to obtain this depth on the first pass with tillage equipment. The implement used shall be a tool carrier with rigid shanks and sweeps or chisels or a heavy duty disk as appropriate to the conditions. The implement shall have a positive means of controlling depth of penetration.

   Lumps or clods exposed by the initial pass of tillage equipment over 2-inches in diameter shall be broken up. The number of additional passes required breaking up lumps or clods shall be kept to a minimum. Working the soil to a fine, pulverized condition shall be avoided.

   After seedbed preparation has been completed, the Contractor shall pick up and dispose of all loose stones or boulders having a vertical projection of 2-inches or more above the soil surface. Logs, stumps, brush, weeds, cables, or other foreign material, which might interfere with the proper operation of drills, mowers, or other implements, shall be disposed of by the Contractor.

   b) **Reseeding of Previously Seeded Areas:** Shall be the same as those in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2004 Edition section 730.

   c) **Drilling:** The specified seed mixture shall be drilled in uniformly, using a press drill equipped with individually mounted, adjustable, spring-loaded, double-disk furrow openers, fitting with depth control bands or drums.

   The depth control bands or drums shall provide a loose planting depth of 1 to 1 ½ - inches (distance from band to edge of opener disk) before compaction by the press wheel and a final planting depth of ¾ to 1-inch behind the wheel press.

   The press drill shall be mounted on rear press wheels, which carry a major portion of the weight of the drill and having no weight carrying wheels at the ends of the seed box. The press wheels shall be mounted independently of the furrow openers. A press wheel shall follow directly behind each opener to compact the soil over the drill row.

   The seed box shall be equipped with positive feed mechanisms, which will accurately meter the seed to be planted, and agitators which will prevent bridging in the seed box and keep seeds uniformly mixed during drilling. The drill shall conform to the following:
Drill Width Maximums:

- Single Units: 10-feet
- Flex coupled side-by-side units: 16-feet (max. two 8-foot members)

4) Hydroseeding

The specified seed mixture shall be hydro seeded uniformly, using a hydro seeder.

The hydro seeder shall be equipped with a gear-driven pump and a paddle agitator. Agitation by re-circulation from the pump will not be allowed. Agitation shall be sufficient to produce homogeneous slurry of seed and fertilizer in the designated proportions.

Fertilizer of the specified formulation shall be included at the specified rate.

Specified seed mixtures shall be included at the specified rate. No seed shall be added to the slurry until immediately prior to beginning the seeding operation.

Legume seed shall be pellet inoculated with the appropriate bacteria. Inoculation rates shall be four times that required for dry seeding.

The time allowed between placement of seed in the hydro seeder and emptying of the hydro seeder tank shall not exceed 30-minutes.

Wood cellulose fiber mulch shall be degradable, wood cellulose fiber or 100% recycled long-fiber pulp, free from weeds or other foreign matter toxic to seed germination and suitable for hydro mulching.

5) Fertilizing

Fertilizer shall be applied not more than forty-eight (48) hours prior to seeding or sodding, unless otherwise approved by the Engineer. Fertilizer shall be applied by one of the following methods:

a) With a fertilizer attachment on the drill. This method will place the fertilizer in a band on, or near, the drill row behind the openers during the drilling operations.

b) By drilling in with an approved drill prior to seeding.

c) By spreading the fertilizer uniformly over the areas to be seeded prior to or during seedbed preparation (before final pass). This method will not be acceptable when seedbed preparation is not required.

d) Where the seed is sown by a hydraulic seeder, the required amount of fertilizer may be placed in the tank, mixed together with the water and the seed, and applied in the seeding operation.

e) Where required on areas to be sodded, thoroughly mix fertilizer into the top one (1) or two (2) inches of soil prior to laying sod.

f) On slopes steeper than 3:1, where fertilizer cannot be incorporated into the soil effectively by mechanized equipment, fertilizer may be applied by any approved method and raked in to a depth of approximately one (1) inch.

Clods and stones having a vertical projection of two (2) inches or more above the soil surface and other foreign materials brought to the surface shall be removed.
The Contractor shall, prior to acceptance of the project, re-fertilize any area on which the original fertilizer has been lost or displaced, as determined by the Engineer.

6) Mulching:

a) Grass Hay or Straw Mulch

   • Placing Mulch: The rate of application shall be 4000 lbs. per acre unless otherwise specified by the Engineer. The mulch shall be placed within forty-eight (48) hours after the seeding has been completed. Mulching operations shall not be performed during periods of high winds, which preclude the proper placing of the mulch. The placing of mulch shall begin on the windward side of the areas to be covered.

   The mulch shall be blown from a machine designed for that purpose and uniformly distributed over the seeded areas. The machine for placing the mulch shall be of an approved type, which will blow or eject, by constant air stream, a controlled amount of mulch. The machine shall cause a minimum of cutting or breakage in the length of the mulch.

   Mulch containing excessive moisture, which prevents uniform feeding through the machine, shall not be used. Bales shall be broken up and loosened as they are fed into the blower to avoid placing of matted or unbroken lumps.

   Mulch shall be placed uniformly over the seeded areas at the plan specified rates. The rates of application may be varied with the approval of the Engineer. Approximately ten percent (10%) of the soil surface shall be visible through the mulch blanket prior to mulch tiller (punching) operation.

   Any existing cover left in place, as specified in Section 70.3C.2, shall be used as mulch, and the specified rate for mulching shall be reduced to leave ten percent (10%) of the soil surface visible through the mulch blanket and a loose thickness of cover of about one (1) inch prior to the punching operation.

   Excessive cover, which will smother seedlings of small seeded grasses, shall be prohibited. The Engineer may order the placement of mulch on any area where protection is considered necessary to forestall erosion or encourage turf establishment.

   • Punching: Immediately following application, the mulch shall be punched into the soil by a mulch tiller consisting of a series of dull, flat disks with notched or cutout edges. The disks shall be approximately twenty (20) inches in diameter, one-fourth (1/4) inch thick, and shall be spaced approximately eight (8) inches apart and shall be fitted with scrapers.

   Working width of the tiller shall not exceed six (6) feet per member, but may be operated in gangs of not over three (3) members. The tiller shall be operated on contour, except on slopes 3:1 or steeper, where the Engineer may order diagonal operation and, if necessary, dual drive wheelers or crawler tread on the tractor to minimize side slip and rutting damage to slopes.

   Tiller members shall be ballasted to push mulch into the soil approximately three (3) inches with ends exposed above the soil surface. When light disking is required in existing cover so the seed can be drilled into a depth of one (1) to one and one-half (1 ½) inches, the tiller members shall be ballasted to push mulch into the soil with the ends exposed above the soil surface. The Engineer shall determine on construction the depth to which the mulch is to be
The mulch tiller shall follow as closely as possible behind the mulch blower. Mulch shall not be blown when the wind velocity causes appreciable displacement before it can be anchored by the mulch tiller. The Engineer may require more than one (1) pass of the mulch tiller or diagonal passes where necessary to assure adequate anchoring.

b) **Fiber Mulch**: Rate of application shall be 2000 lbs. per acre unless otherwise specified by the Engineer. Excessive thickness of mulch, which will smother grass seedlings, shall be avoided. Mulch shall be placed on a given area as soon as possible, or within forty-eight (48) hours after seeding.

c) **Compost**: Apply a one-fourth (1/4) inch layer of compost over the seeded area, then water to protect against hot, dry weather or drying winds.

d) **Hydroseeding Tackifier Amendment**

- **Hydroseeding**: When using as a tackifier with paper or fiber mulch, add three (3) lbs per acre. Slowly pour the tackifier into the water and thoroughly mix in the tank. Add mulch, seed, fertilizer and any other components in the tank and thoroughly mix.

- **Straw Tacking**: Apply three (3) lbs. per acre with 750 lbs. of wood or paper mulch.

- **Temporary Dust Control**: Apply to non-traffic areas at a rate of three (3) lbs. per acre with 1000 gallons of water. On slopes of 4:1 to 2:1, apply at a rate of 6 – 12 lbs. per acre.

- **Clarifying sediment/holding ponds**: Slowly pour two-three (2 -3) lbs. of tackifier into 1000 gallons of water while the tank is agitating. Thoroughly mix for 15 minutes and spray to one surface acre of water.

7) **Care During Construction and Final Acceptance**

Traffic, either foot, equipment or vehicular, shall be kept to a minimum over the seeded and mulched area.

The Contractor shall, prior to acceptance of the project, re-mulch any area on which the original mulch has been displaced as a result of excessive wind, water, or other causes.

With the exception of the above items, the rest of the Construction requirements shall be the same as those in the South Dakota Department of Transportation 'Standard Specifications for Roads and Bridges’ 2004 Edition sections 730, 731 and 732.

4. **METHOD OF MEASUREMENT**

Landscaping will be measured on a lump sum basis.

5. **BASIS OF PAYMENT**

Landscaping will paid at the contract lump sum payment for full compensation for preparing a seedbed, furnishing and planting seed, furnishing and applying fertilizer on seeded areas, and placing a mulch cover on slopes or other designated areas following seeding and fertilizing operation, except on roadbeds, within the limits of the work.

**END OF LANDSCAPING**
10100 - PLANTING TREES, SHRUBS, AND VINES

1. DESCRIPTION

This work consists of furnishing and planting or transplanting trees, shrubs, vines or other plants of the species, grade and size specified. Included is the preparation of the ground, storage, staking, wrapping, furnishing and placing topsoil, peat moss, mulch, water, and other incidentals.

2. MATERIALS

A. Plant Materials (Nursery Stock)

1) Limitations on Source of Material: Plants furnished shall have been grown in western South Dakota or states or provinces located within the boundaries of Hardiness Zones 2, 3, or 4, as established by the United States Department of Agriculture.

2) Notification of Source of Supply and Verification of Origin: As soon as possible, and before any planting, the Contractor shall furnish written notification of the location of the proposed source for each item of plant materials. The Engineer may require the Contractor to furnish written verification from the supplier and grower to establish the origin of plant materials, seed, or vegetative material. The source of supply and origin of plant materials will be subject to approval.

3) Names of Plants: Plant materials furnished shall be of the genus, species, and variety specified and shall follow standard names of plant materials as adopted by the American Joint Committee on Horticultural Nomenclature and as this standard nomenclature is referred to in the current edition of Standardized Plant Names. Substitutions will not be permitted without the written consent of the Engineer.

4) Form, Shape, and Condition of Plants: Trees furnished shall have been at least twice transplanted or root pruned, shall be well branched according to species or variety, and uniformly straight-trunked. Shrubs shall have been at least twice transplanted or root pruned and is heavily caned. Trees, shrubs, and vines shall be number one (1), heavy-grade, nursery-grown stock, strong, healthy, clean, well-grown, free from insects, disease, rodents, mechanical injuries, disfiguring knots, sunscald, frost cracks, broken bark, broken or dead branches, broken roots, stubs, or any other objectionable features and shall possess a healthy, normal root system of sufficient size to permit successful establishment and good growth and shall be typical of the species or variety specified. Evergreen plants delivered to the project with new growth in an advanced stage of candling out will be rejected.

5) Size of Plants: Plants shall be of uniform height and diameter. The figures shown on the plans indicate the minimum height of the plants called for. When such figures are used in connection with spread, they indicate the minimum and maximum spread of the plant to be furnished.

The height of each species or variety of plant shall be the vertical measurement of the plant from the ground upward as it stands in its natural position in the nursery without straightening branches or leaders. The measurements shall not include the fine or slender terminal leader, twig or branch growth, but shall stop where the main part of the plant ends. The spread of each species or variety shall be the horizontal measurement of the plant as it stands in its natural position in the nursery without straightening its branches. The measurements shall not include the fine or slender terminal shoots. Each plant shall be measured both in its smallest and greatest dimension and averaged. Caliper shall be taken six (6) inches above the ground level, up to and including four (4) inches caliper size, and twelve (12) inches above ground level for larger sizes.
6) **Nursery Stock:** Plant materials shall be nursery grown unless otherwise specified, shall have been subjected to proper transplanting during growth in the nursery, shall bear evidence of proper top and root pruning, and shall be thrifty, well-grown, and hardy northern stock, grown under the same climatic conditions as exist at the location to be planted. Plants shall meet the standards as set forth in South Dakota Nursery Laws and in the edition of the American Standard for Nursery Stock. In all cases where grades are indicated in these standards, No. 1 or top grade will be required.

7) **Labeling:** Legible labels must be attached to all specimens, boxes, bundles, bales, or other containers indicating the genus, species, size, grade, or age of each species or variety and the quantity contained.

8) **Inspection, Certificate, and Rejection of Plants:** Before removal from the nursery, plant materials, must be inspected by authorized Federal or State authorities. Plants must be declared and certified free of diseases and insects, and necessary inspection certificates to this effect must accompany each shipment, invoice, or order of plants. Plants not approved by the Plant Industry Representative or Nursery Inspector or otherwise not meeting these specifications will be rejected. Rejected plants shall immediately be removed and disposed of by the Contractor and replaced with approved nursery stock of like variety, size, and age at no additional cost.

### B. Incidental Materials

1) **The topsoil** shall conform to the requirements of Section 17.

2) **Organic soil** conditions shall be granulated peat moss or other material as specified. The granulated peat moss shall be furnished in an air-dry condition and shall be free from woody substances and mineral matter such as sulfur or iron.

3) **Mulching material** shall be as specified.

4) **Staking materials** shall be six (6 ft.) foot T type studded steel posts. Guy wire shall be a minimum of twelve (12) gauge.

5) **Wrapping material** shall be a two (2) ply asphalt cemented Kraft Crepe paper in strips or burlap in strips and shall be secured to the trunk with a good-quality six (6) ply cotton.

6) **Tree ties** shall be a minimum of one (1) inch wide, heavy duty canvas, with a steel grommet in each end to secure tie wire. Tie wire shall not be wrapped around tree, but shall be tied through the steel grommets in the canvas wrap. Lengths of garden hose shall not be used.

7) **Tree trunk guards** shall be a minimum six (6) inches in diameter by twelve (12) inches in length, flexible PVC drain tile pipe.

### 3. CONSTRUCTION REQUIREMENTS

The digging, transporting, storing, layout, planting, pruning, watering, mulching, wrapping, staking, maintenance, and replacement of plants shall be performed by a qualified nurseryman, landscape specialist or by experienced crews under the direct supervision of a qualified nurseryman or landscape specialist.

A. **Digging and Transporting Nursery Stock:** Plants shall be dug with care and skill immediately before shipping. Possible injury to the roots, particularly to the fibrous roots, shall be avoided. Balled and burlapped plants shall be dug to retain as may fibrous roots as possible and shall come from soil which will form a firm ball. The soil in the ball shall be the original undisturbed soil in which the plant has been grown. The plant shall be dug, wrapped, packed, and transported in such a manner that, upon delivery, the soil in the ball will not have been cracked, loosened, or caused to drop away from contact with the
small and fine feeding roots.

As plants are dug and during transportation to the planting site, precautions shall be taken to prevent roots from drying out, balls of earth from being broken, and to otherwise assure the arrival of plants at their destination in good condition.

B. Temporary Storage: Plant materials which cannot be immediately planted upon delivery shall be heeled in by placing the plants in a trench in a shaded location and covering the roots firmly with moist soil or by storing in a cool, most cellar or similar enclosure with roots packed in wet sphagnum moss and covered with tarpaulins. Other methods of storage must be approved by the Engineer. Roots shall be kept thoroughly moist at all times and stored plants shall be properly maintained by the Contractor. Balled and burlapped plants shall be protected against drying by covering with wet sawdust, soil, or peat moss in a manner appropriate to the conditions.

Risks involved in storing and transporting plant materials shall be borne by the Contractor.

C. Stalking and Layout of Planting: Planting holes shall not be dug until all plant locations have been staked. Plan-shown locations, spacings and quantities may be adjusted by the Engineer to suit field conditions.

D. Planting-General Requirements: The Contractor shall notify the Engineer at least one (1) week in advance of the beginning of the planting operation.

During planting operations, suitable warning signs shall be provided in accordance with Section 7.

E. The Planting Operation

1) Digging of Planting Holes:
   a) The Contractor shall provide necessary safeguards to prevent accidents during the time the plant holes are open.
   b) Planting holes shall have vertical sides and flat bottoms. The holes shall be of sufficient diameter to provide for not less than 12 (12) inches of topsoil backfill around the root ball. The hole shall be no deeper than the root ball is tall. Set the rootball on firm soil so that the top of the rootball will sit slightly higher than the final grade.

2) Mixing Backfill Soil: Prior to planting, topsoil to be used for backfilling plant holes shall be thoroughly mixed with twenty-five (25%) percent peat moss by volume.

3) Care of Plants Prior to Planting: When plants are taken from storage to the planting site, roots of plants shall be immersed in water immediately upon opening the bunks and kept in water until planted. The Contractor shall have sufficient tanks and pails to keep roots of plants from opened bundles in water until planted.

In transferring plants from the site of temporary storage to the planting site, only plants that can be planted in that day shall be transferred. Material not planted the day it is taken from storage shall be rewrapped in the approved manner or the roots kept immersed in water at the storage site until planted. Bare roots shall not lie exposed to the sun or air.

4) Method of Planting
   a) Bare-Rooted Plants: Plants shall be set in the bottom of the planting holes on a compact cone of soil constructed by backfilling the planting hole with topsoil. Trees and shrubs shall be placed at the same depth as they grew in the nursery.
Roots shall be carefully spread over and around this cone of topsoil in their natural position. Roots, when are broken or damaged, shall be cut back to firm tissue. After placing the plant in the hole and spreading the roots, topsoil shall be tampered in place carefully but firmly to ensure that topsoil is around all of the roots and air pockets are not present. Care shall be taken to avoid bruising or breaking the roots when firming the soil around them.

b) **Balled and Burlapped Plants:** Plants shall not be handled by the plant stem. After the planting hole is dug as described in 3.F.i.2, the bottom portion of the wire basket shall be cut away prior to setting the plant in the hole. After setting the plant in the planting hole, the remaining portion of the wire basket shall be removed and the burlap cut six (6) inches below the top of the root ball. All twine and shipping tree wraps shall be removed from the trunk. Balled and burlapped plants shall have a minimum of twelve (12) inches of topsoil packed around the sides of the root ball.

c) **Potted Plants:** Potted plant holes shall be dug as described in 3.F.i.2. All plants shall be removed from containers in a manner which does not damage the root ball.

Holes can be backfilled in not less than two (2) lifts. The first lift shall not exceed one-half (1/2) total hole depth. Each lift shall be heel stamped.

5) **Cultivation:** Shrub beds are to be cultivated as a unit two (2) feet on each side of rows before planting and the plants placed separately.

6) **Watering:** All plants shall be thoroughly watered within four (4) hours of planting and every seven (7) days thereafter until a letter of acceptance for the project is received from the Engineer. Each plant shall receive the gallon equivalent on the size of the root ball planted, at each watering.

7) **Mulching:** Mulch shall be placed between and around the plants within forty-eight (48) hours after planting and shall be applied uniformly to cover the cultivated areas inside dikes to a depth of three (3) inches. Mulch shall be pulled back a minimum of one (1) foot from trunks and canes.

8) **Wrapping:** Newly transplanted deciduous trees shall be wrapped with strips of two (2) ply Kraft asphalt crepe paper or burlap, starting at the bottom and lapping one-half (1/2) strip to a point well into the crown of the tree and not less than four (4) feet above the ground. Wrapping shall be secured with six (6) ply cotton twine, starting at the top and wrapping toward the bottom, or with as many separate ties as necessary to hold the wrapping security but loosely enough to allow a normal season’s growth.

9) **Staking:** Each newly-planted deciduous tree under three (3) inches in caliper or conifer tree under eight (8) feet in height shall be staked with three (3) standard “T” type studded posts. The posts shall be driven an adequate distance away from the trunk of the tree so they are not driven into the root ball of the newly planted tree. A tie wire, 12-gauge minimum, shall be used for each post. Canvas tree ties shall secure the tie wire to the tree as specified in 2.B.6. Three (3) ties per tree are required.

10) **Guying:** Deciduous trees over three (3) inches in diameter or conifers over eight (8) feet in height shall be guyed. Guy wires, minimum 12 gauge, shall be secured using canvas tree ties and six (6) foot “T” type studded posts. Three (3) guys per tree are required. Posts shall be driven a minimum of two (2) feet into the ground.

11) **Cleanup:** When planting has been completed, debris and waste materials shall be removed from the area, excess earth materials graded or otherwise removed, damaged turf reseeded, and the area left
in a neat, orderly, and finished condition.

12) Establishment Period: An establishment period shall begin immediately after original planting is made and shall continue for one year. The plants shall be guaranteed during this period against defects, including death and unsatisfactory growth, except for defects resulting from neglect by Owner, abuse, or damage by others, or unusual phenomena or incidents, which are beyond, landscape installer’s control.

Contractor shall be responsible for watering all plants until a letter of acceptance for the project is received from the Engineer.

13) Replacement of Plants: The Contractor shall remove and replace trees, shrubs or other plants found to be dead or in unhealthy condition during establishment period. The Contractor shall also plant missing trees, shrubs and plants, make replacements during growing season following end of establishment period, and furnish and plant replacements which comply with requirements shown and specified. The Contractor shall also replace trees and shrubs which are in doubtful condition at the end of the establishment period, unless, in the opinion of the Engineer, it is advisable to extend the establishment period for a full growing season. The Engineer will make another inspection at the end of the extended establishment period to determine acceptance or rejection. Only one (1) replacement will be required at the end of the establishment period, except for losses or replacements due to failure to comply with specified requirements.

4. METHOD OF MEASUREMENT

A. Trees will be paid for each specie or variety of tree.

B. Shrubs will be paid for each specie or variety of shrub.

C. Vines will be paid for each specie or variety of vine.

5. BASIS OF PAYMENT

A. Trees will be paid at the contract unit price per tree once satisfactory completion of planting is completed. Payment will constitute full compensation for furnishing, transporting, handling, storing, planting, wrapping, pruning, watering, necessary excavation, disposal of surplus materials, furnishing and placing topsoil, peat moss, staking, mulching material and labor, equipment, tools and necessary incidentals.

B. Shrubs will be paid at the contract unit price per shrub once satisfactory completion of planting is completed. Payment will constitute full compensation for furnishing, transporting, handling, storing, planting, wrapping, pruning, watering, necessary excavation, disposal of surplus materials, furnishing and placing topsoil, peat moss, staking, mulching material and labor, equipment, tools and necessary incidentals.

C. Vines will be paid at the contract unit price per vine once satisfactory completion of planting is completed. Payment will constitute full compensation for furnishing, transporting, handling, storing, planting, wrapping, pruning, watering, necessary excavation, disposal of surplus materials, furnishing and placing topsoil, peat moss, staking, mulching material and labor, equipment, tools and necessary incidentals.

END PLANTING TREES, SHRUBS, AND VINES
10200 – GEOTEXTILES AND IMPERMEABLE PLASTIC MEMBRANE

1. DESCRIPTION

This work consists of furnishing and installing geotextiles, or impermeable plastic membranes, for use in any construction within the public right-of-way.

2. MATERIALS

Materials shall conform to the following table:

<table>
<thead>
<tr>
<th>Test Method</th>
<th>Drainage Fabric</th>
<th>Stabilization Fabric</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grab Strength</td>
<td>ASTM D4632</td>
<td>Min. of 240-lbs</td>
</tr>
<tr>
<td>Sewn Seam Strength</td>
<td>ASTM D4632</td>
<td>Min. of 216-lbs</td>
</tr>
<tr>
<td>Tear Strength</td>
<td>ASTM D4533</td>
<td>Min. of 88-lbs</td>
</tr>
<tr>
<td>Permittivity</td>
<td>ASTM D4491</td>
<td>0.1-sec⁻¹</td>
</tr>
<tr>
<td>Apparent Opening Size</td>
<td>ASTM D4751</td>
<td>Max. of 0.25-mm</td>
</tr>
<tr>
<td>Ultraviolet Stability</td>
<td>ASTM D4355</td>
<td>Min. of 50%</td>
</tr>
</tbody>
</table>

3. CONSTRUCTION REQUIREMENTS

Material shall be installed per manufactures specifications.

4. METHOD OF MEASUREMENT

A. Drainage Fabric shall be measured to the nearest square yard.

B. Stabilization Fabric shall be measured to the nearest square yard.

5. BASIS OF PAYMENT

A. Drainage Fabric will be paid for at the contract unit price per square yard. Payment will be full compensation for furnishing and installing materials.

B. Stabilization Fabric will be paid for at the contract unit price per square yard. Payment will be full compensation for furnishing and installing materials.

END OF GEOTEXTILES AND IMPERMEABLE PLASTIC MEMBRANE
10400 – EROSION CONTROL AND WATER POLLUTION CONTROL

1. DESCRIPTION

This work consists of permanent and temporary measures to control erosion, sedimentation, and water pollution.

2. MATERIALS

Materials shall conform to section 734 found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition.

3. CONSTRUCTION REQUIREMENTS

Materials shall conform to section 734 found in the South Dakota Department of Transportation ‘Standard Specifications for Roads and Bridges’ 2015 Edition.

4. METHOD OF MEASUREMENT

Erosion Control shall be measured by the lump sum.

5. BASIS OF PAYMENT

Erosion Control will be paid for at the contract unit price per lump sum. Payment will be full compensation for furnishing, installing, labor, equipment and incidental required to install any erosion control items. This item shall also include any mucking of silt fences and repair to silt fences that may be required to maintain the erosion control system.

END OF EROSION CONTROL AND WATER POLLUTION CONTROL
